

Cosmological Merger Rates

Not Phil Hopkins
Kelly Holley-Bockelmann
Vanderbilt University and Fisk University
k.holley@vanderbilt.edu

Why do we care so much about the merger rate?

Galaxy mergers transform star-forming disks (blue cloud) to 'dead' spheroids (red sequence)

Why do we care so much about the merger rate?

Galaxy mergers trigger starbursts (Luminous-IR galaxies, Lyman break galaxies, kickstart reionization?, enrich the IGM?)

Why do we care so much about the merger rate?

Galaxy mergers feed super-massive black holes and ignite AGN (DiMatteo + Springel 2005)

Why do we care so much about the merger rate?

Galaxy mergers feed super-massive black holes and ignite AGN (DiMatteo + Springel 2005)

T = 160 Myr

We'd like to know:

‘Galaxy merger rate’ as a function of time, mass,
environment....

Galaxy merger rate == # major galaxy mergers/Gyr/Mpc³

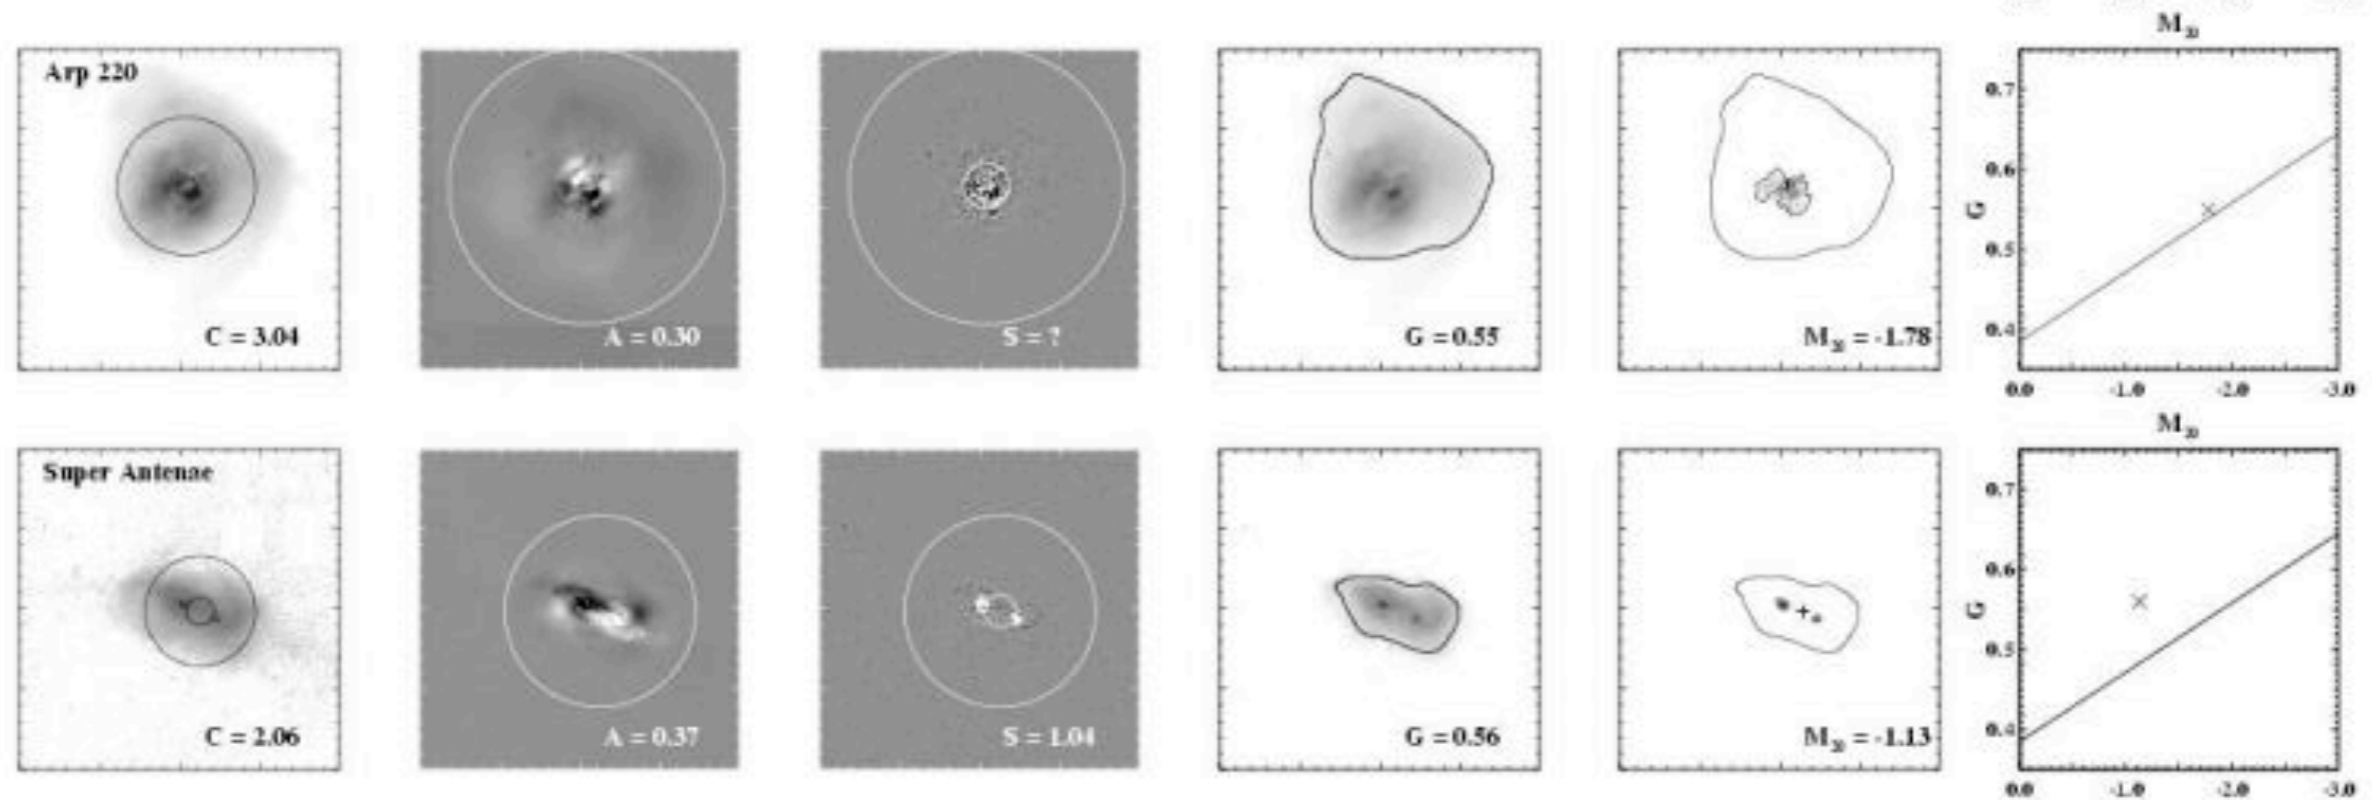

First step: identify galaxy mergers.

Identifying galaxy mergers observationally: close pair counts

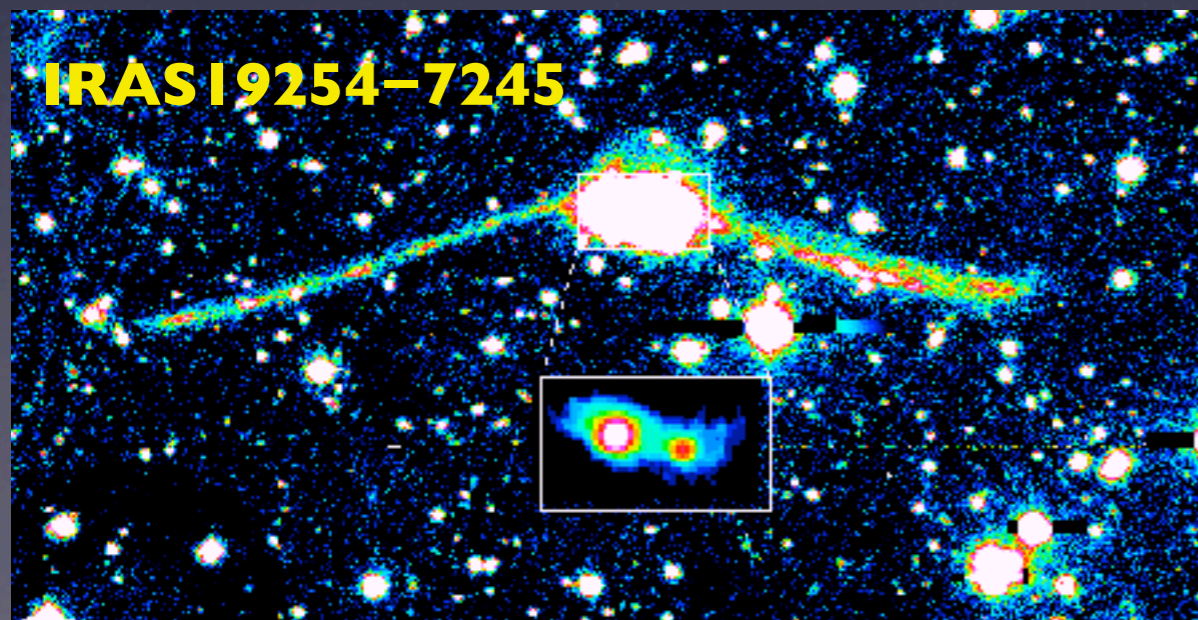

galaxies within $v < 500$ km/sec,
separated by $R < 100$ kpc

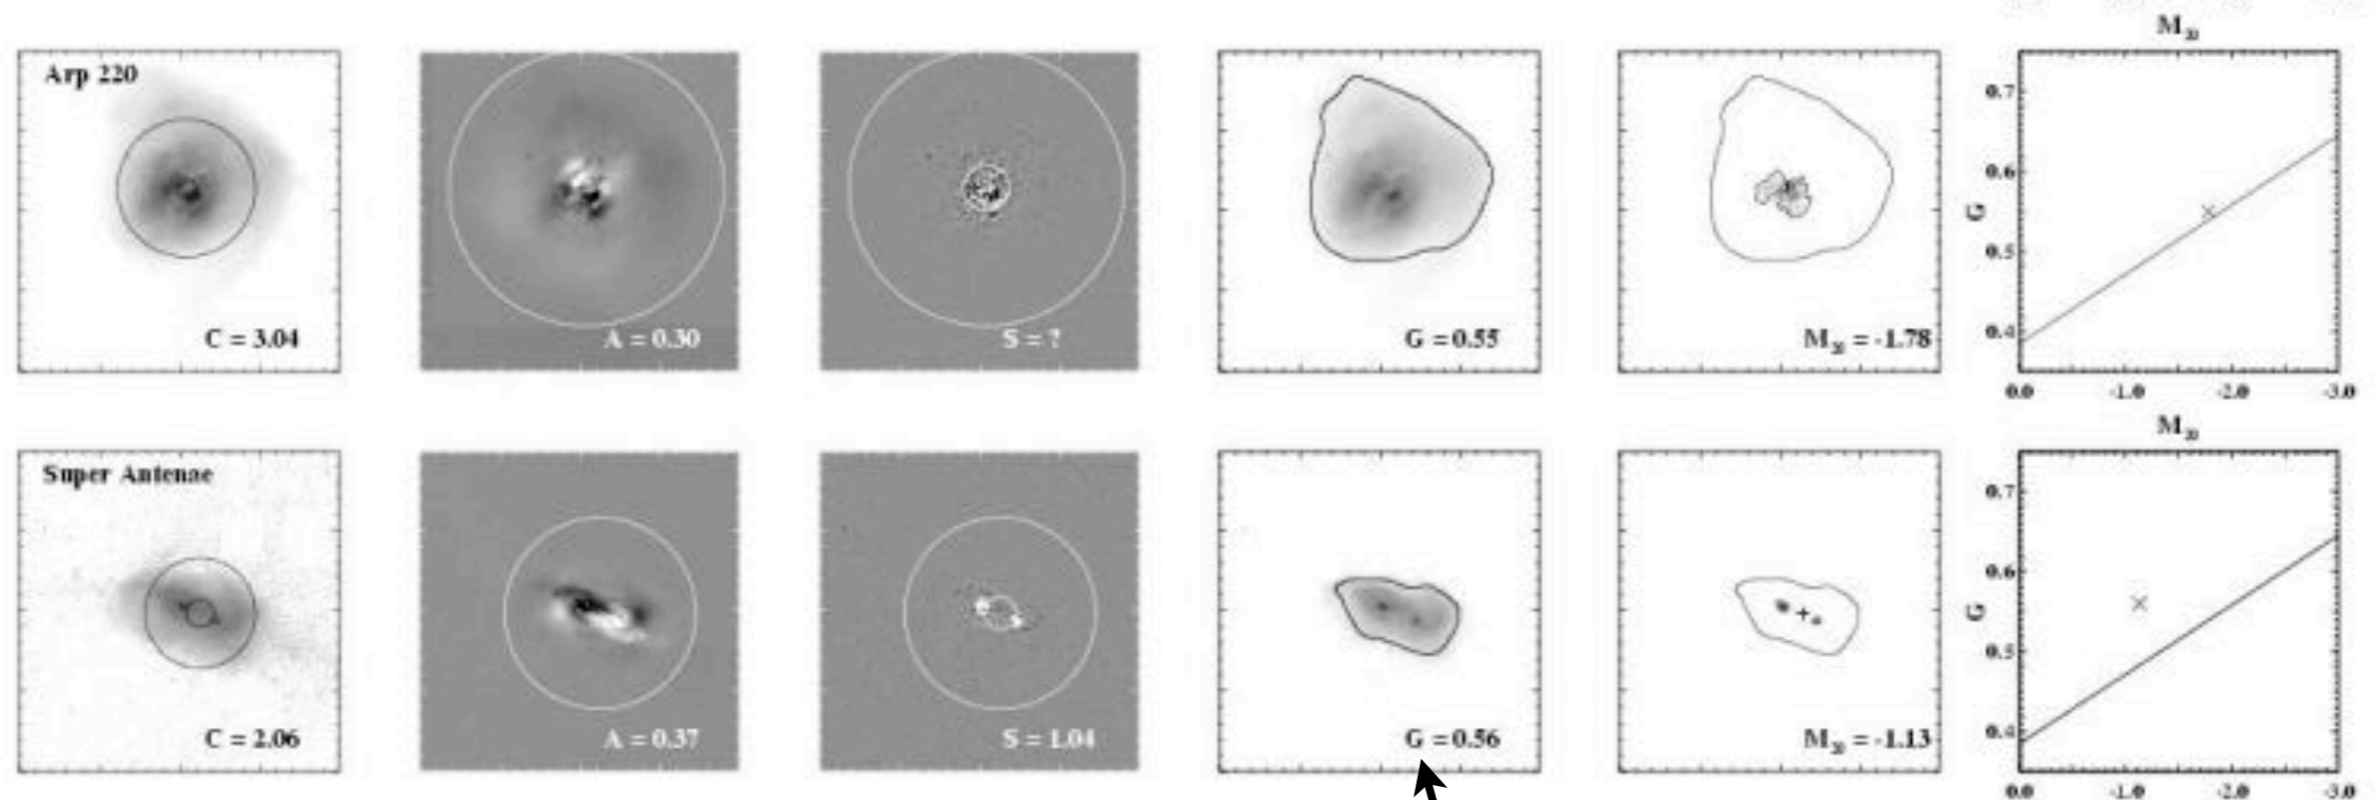

Identifying galaxy mergers observationally: morphological transformation indicators

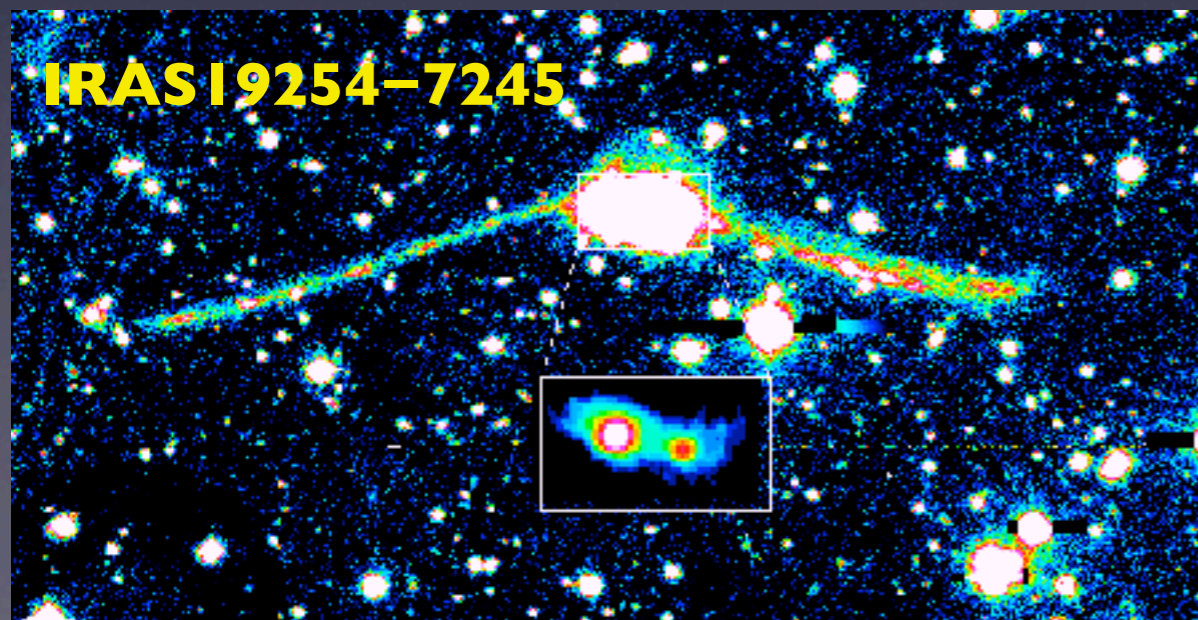

Lotz et al. 2003; Abraham et al. 2003

Identifying galaxy mergers observationally: morphological transformation indicators

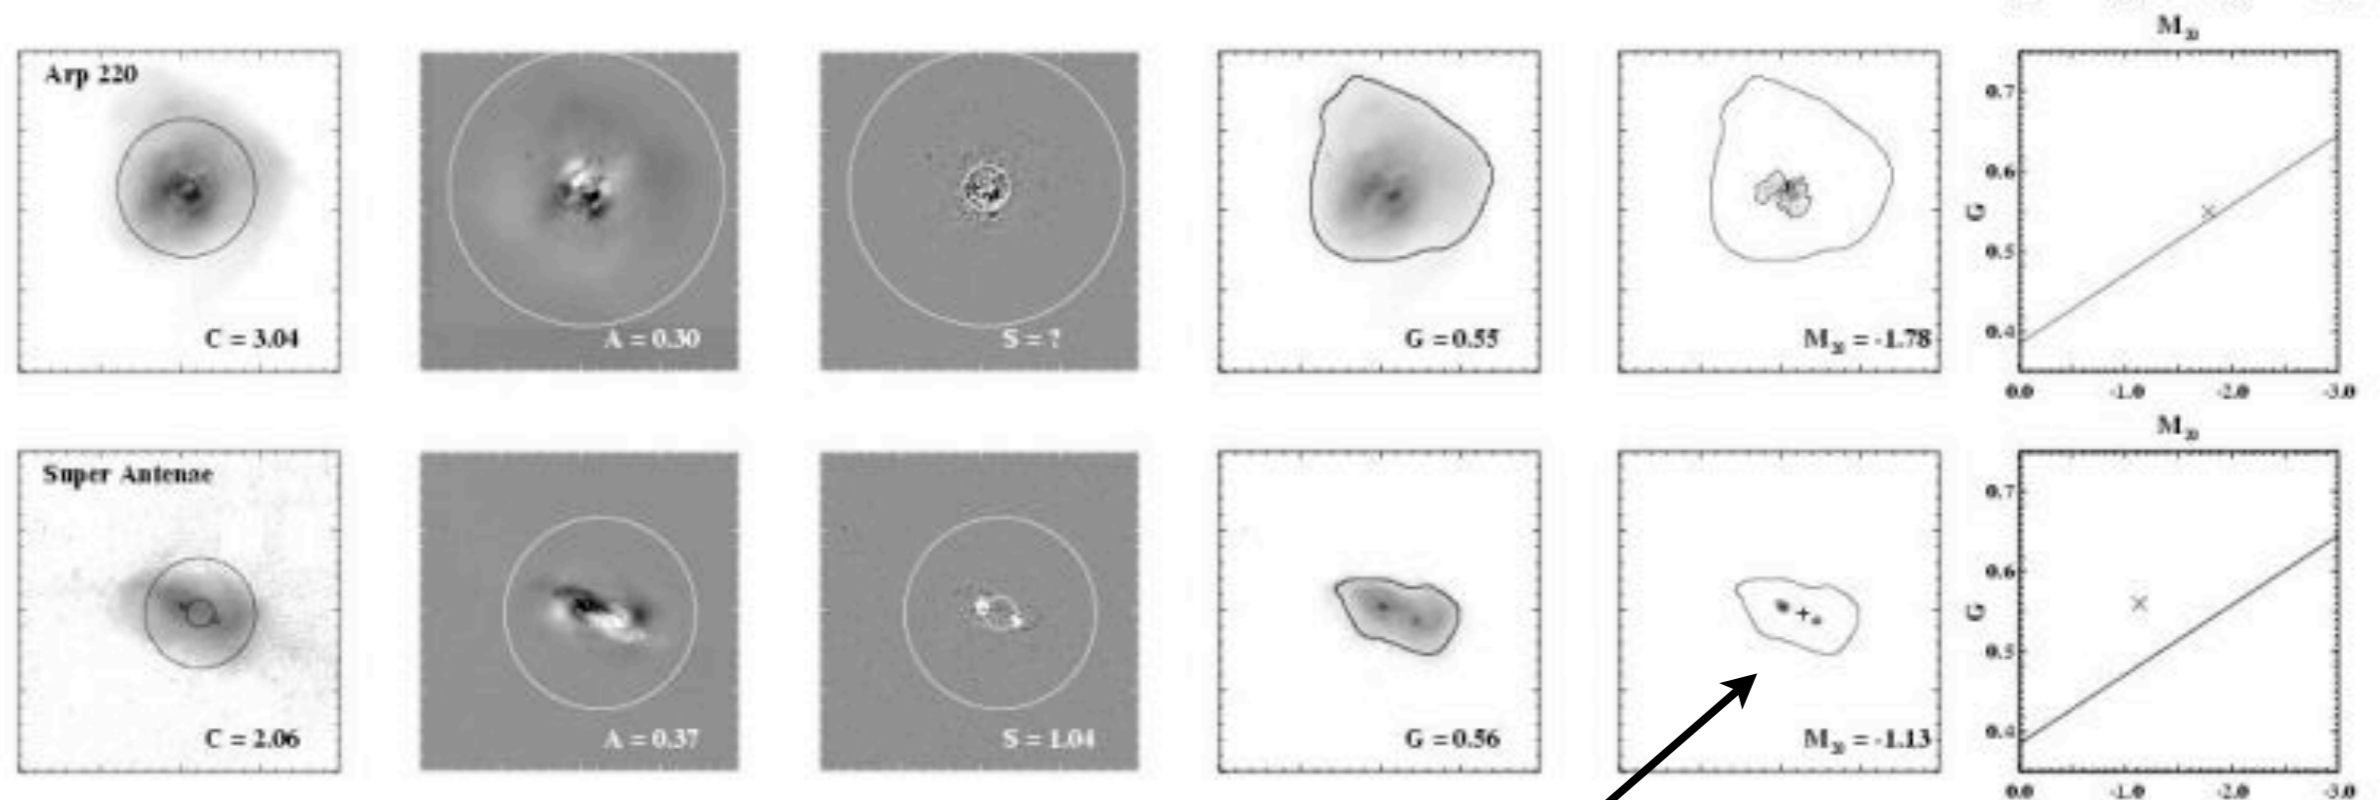

Lotz et al. 2003; Abraham et al. 2003

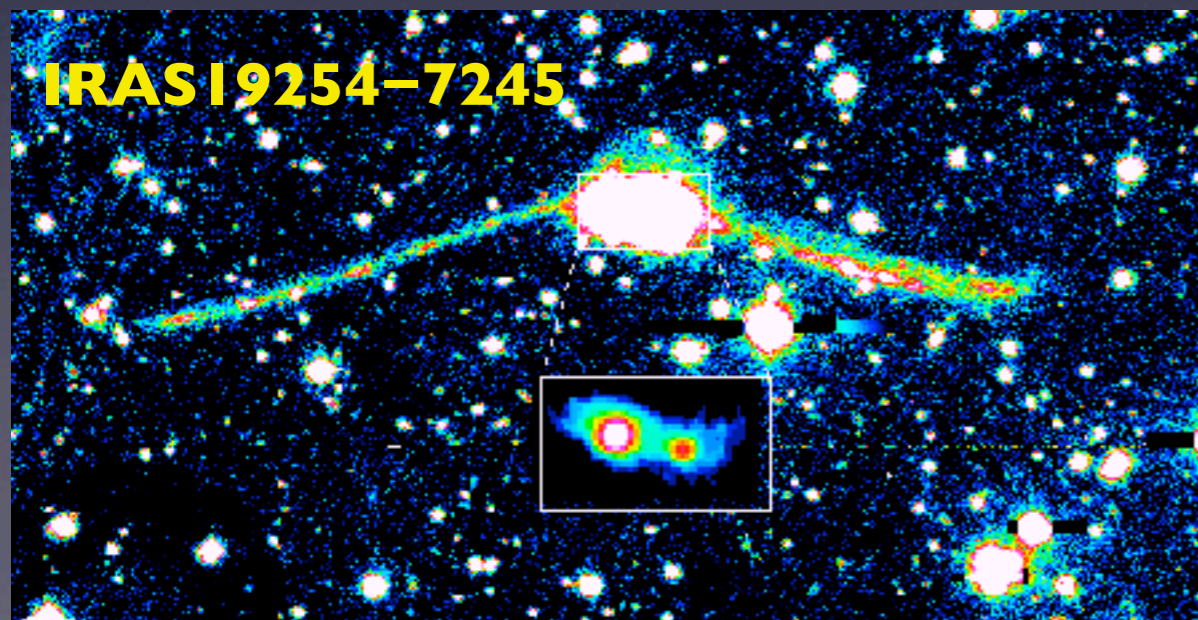

Gini index -- a measure of how equitably the light is distributed

Identifying galaxy mergers observationally: morphological transformation indicators

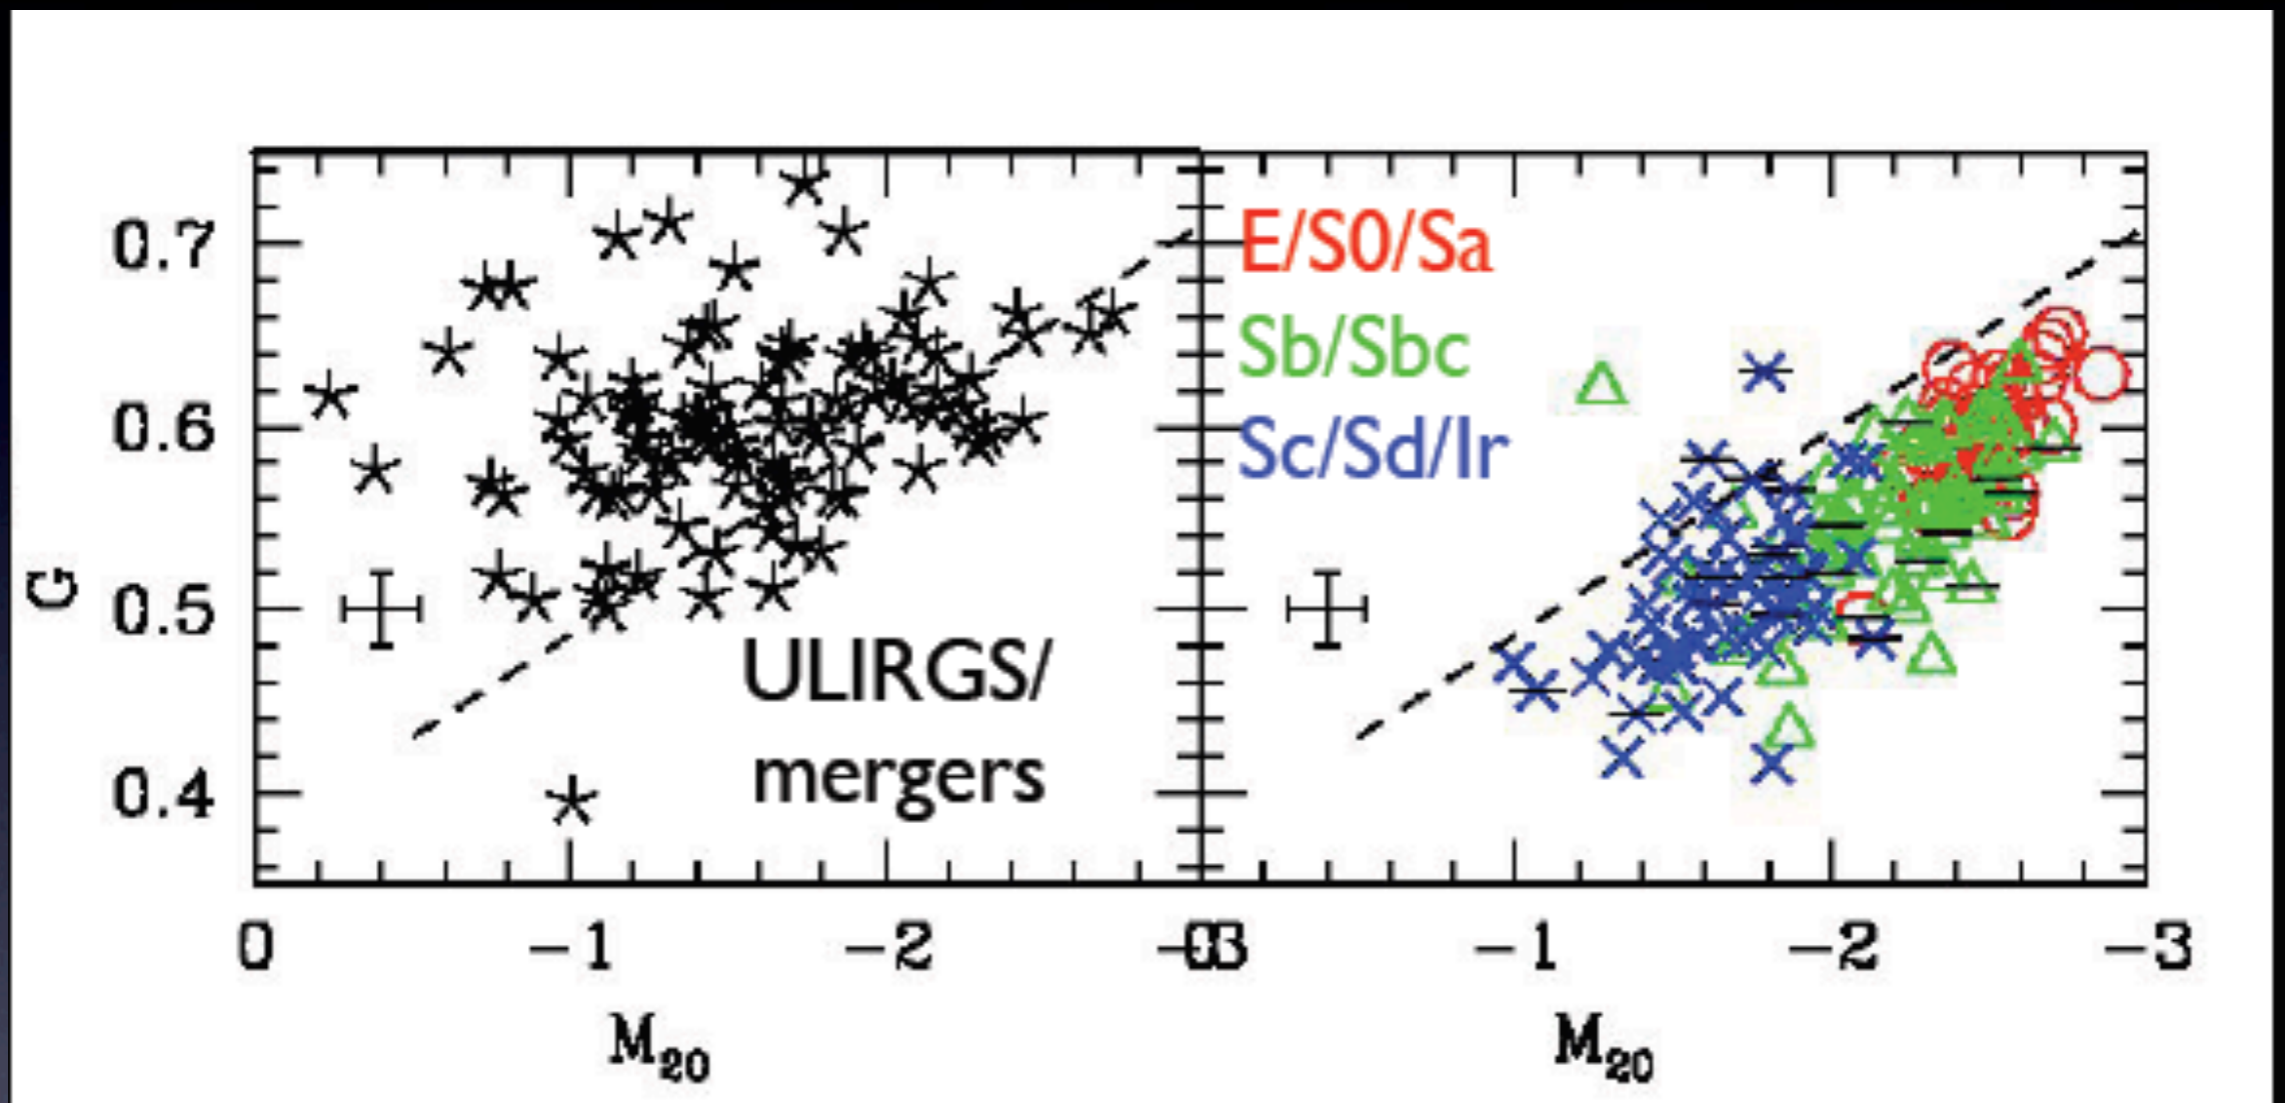

Lotz et al. 2003; Abraham et al. 2003

M20 index --a more generic form
of concentration

Toward a quantitative merger criterion...

Lotz et al. 2004; Conselice 2004

Major mergers separate
from 'normal galaxies' in
Gini-M20 space

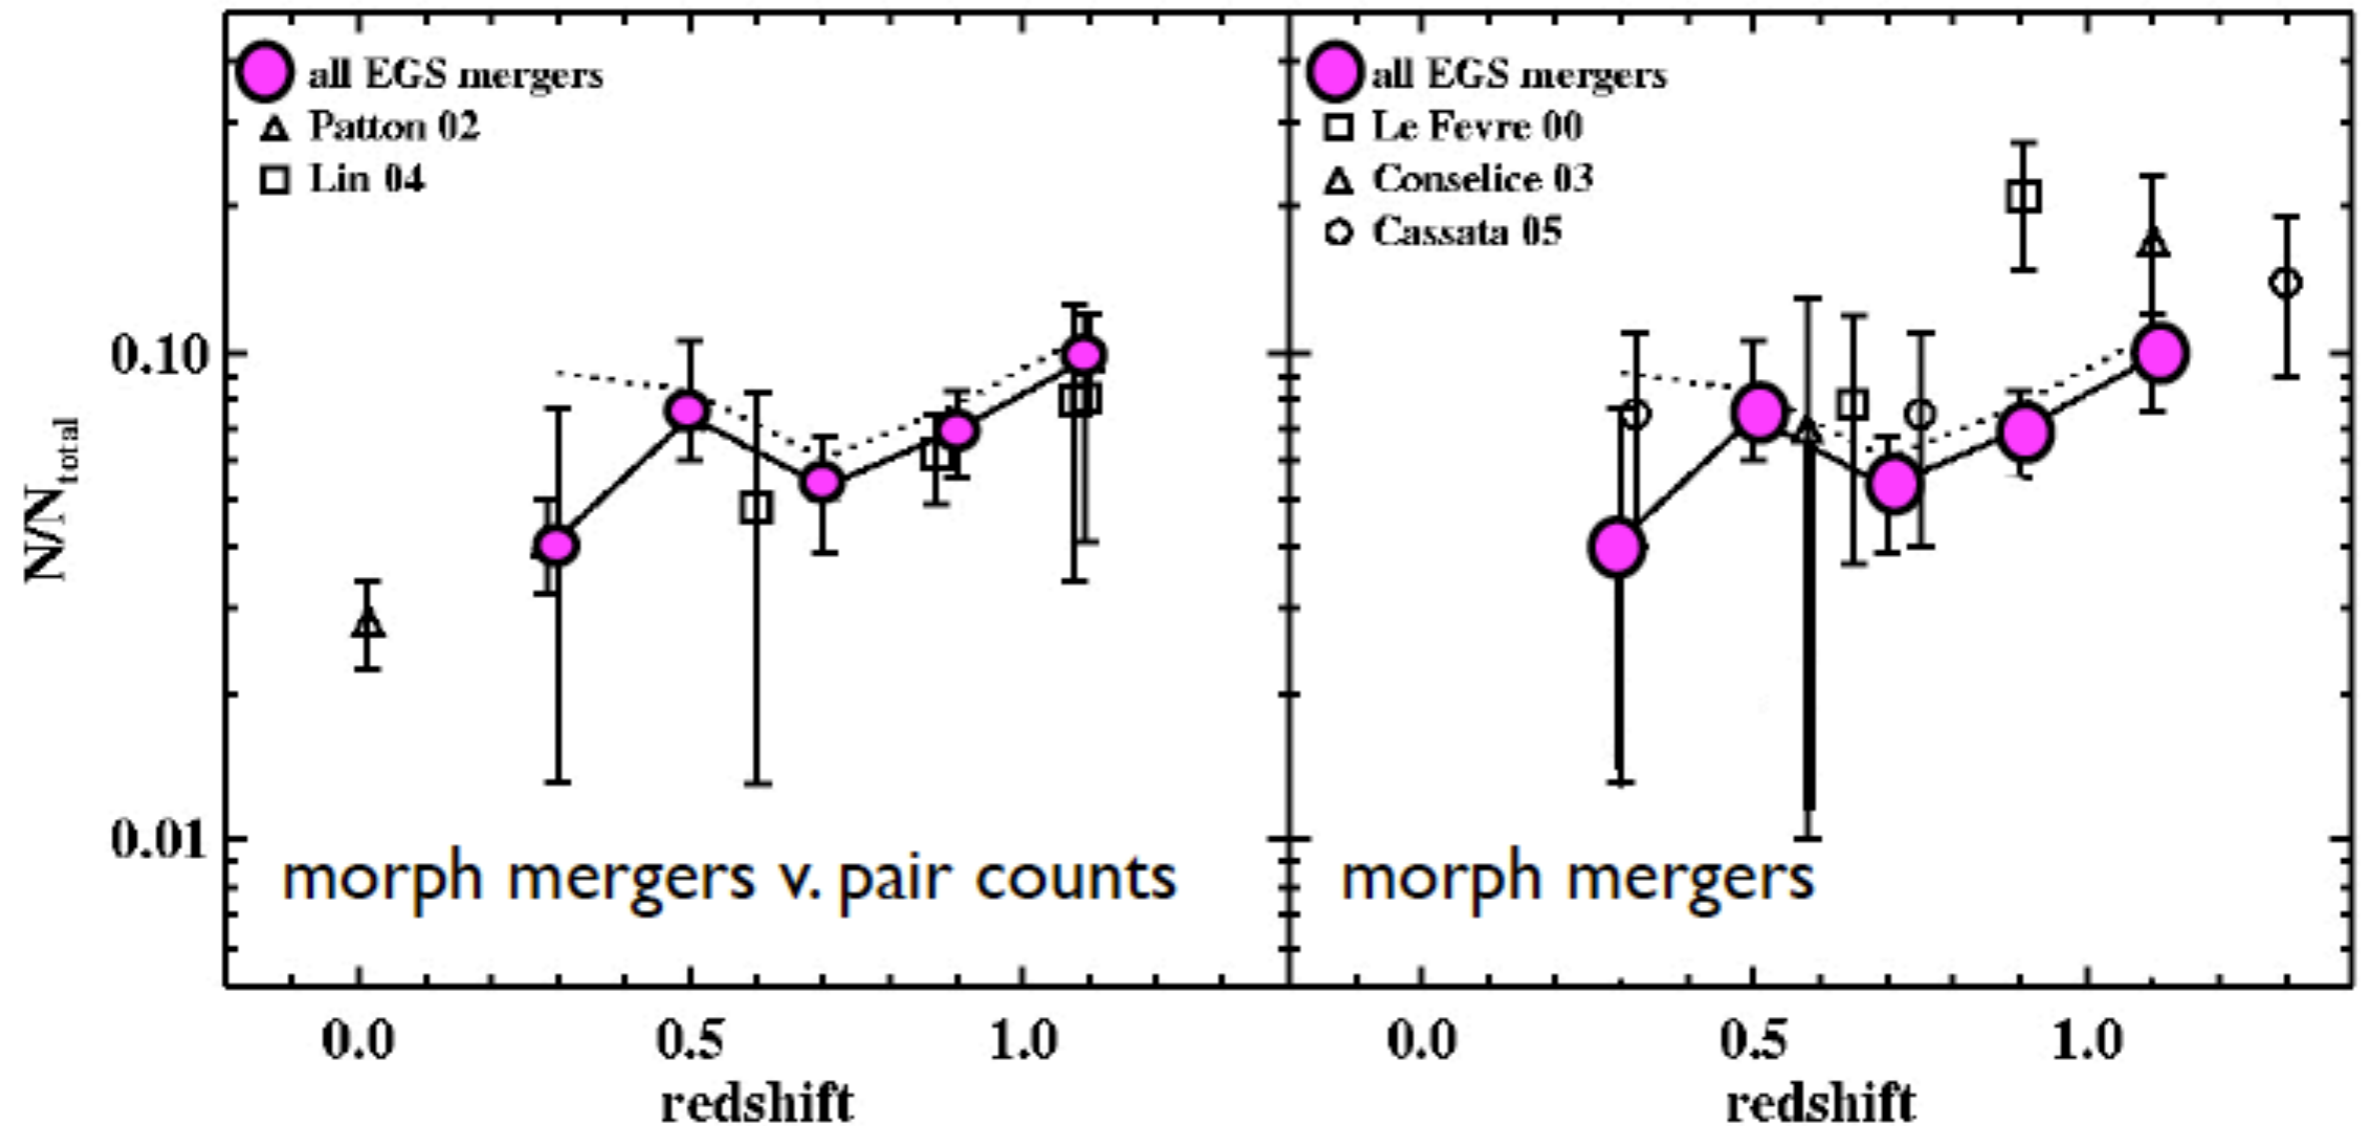

We'd like to know:

‘Galaxy merger rate’ as a function of time, mass,
environment....

Galaxy merger rate == # major galaxy mergers/Gyr/Mpc³

Next step: estimate the merger timescale.

Evolution in Merger Fraction at $z < 1.2$

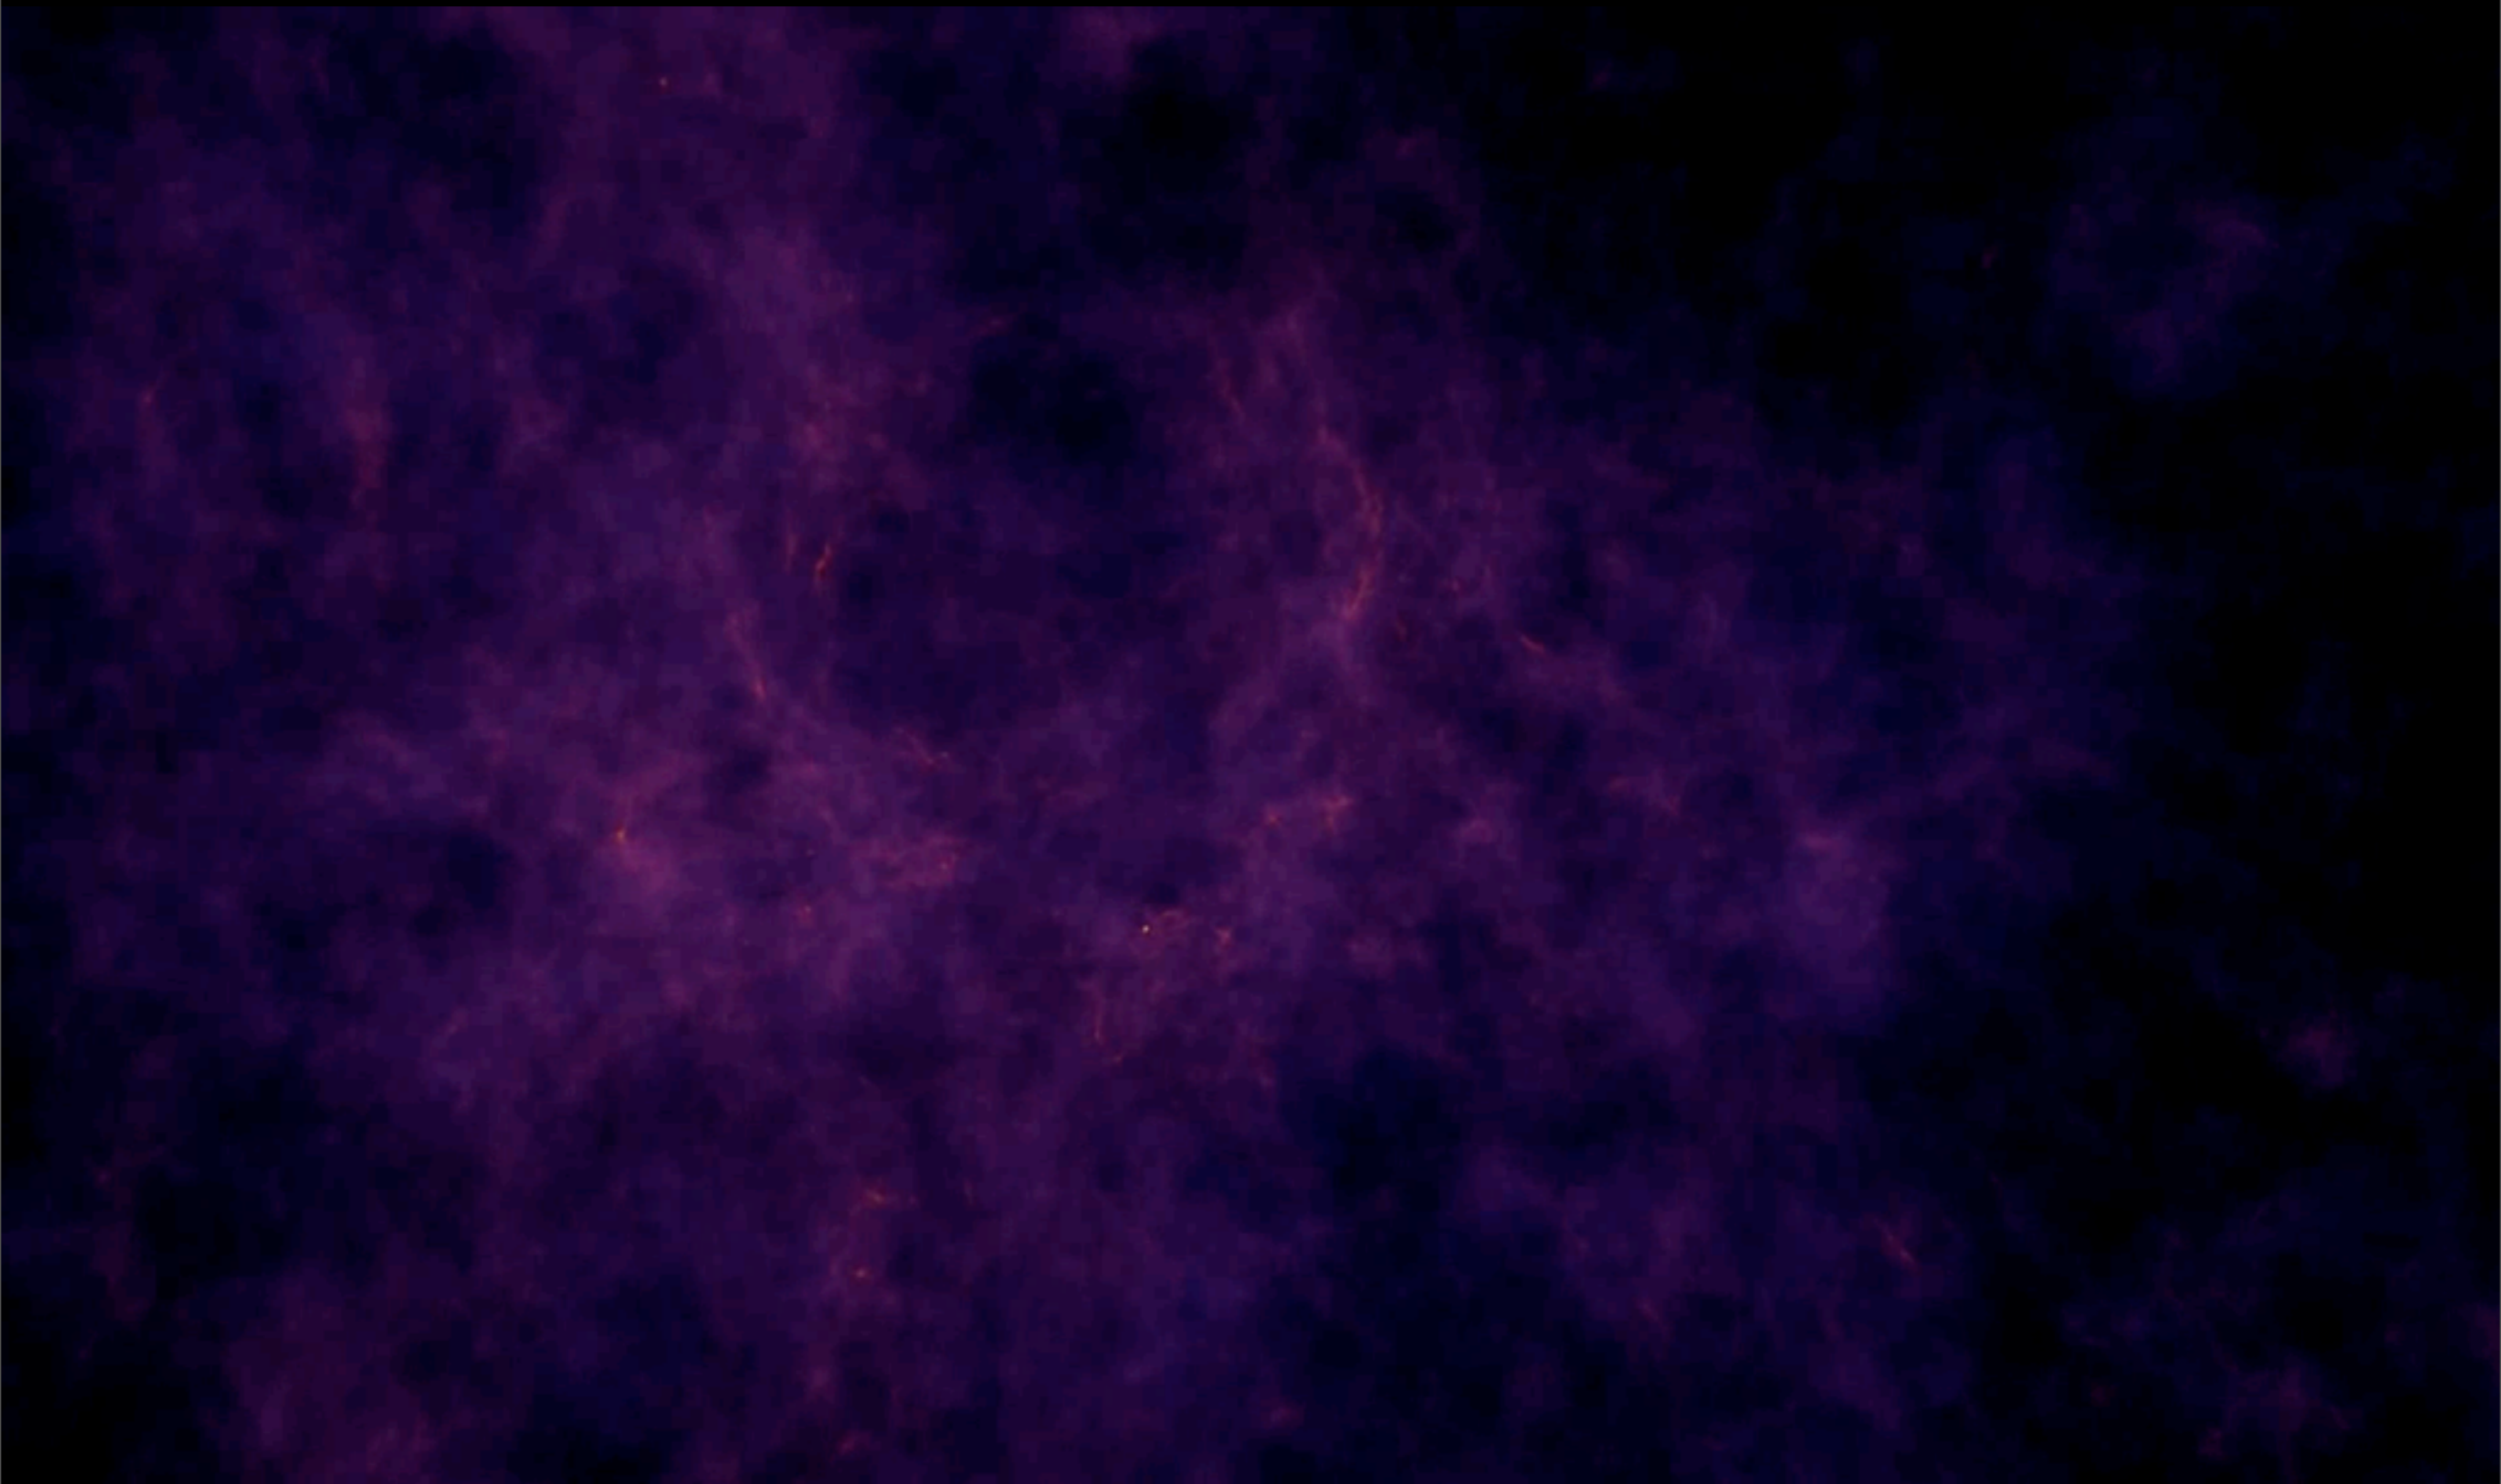

$$f_{\text{merger}} \sim (1+z)^m \Rightarrow m = 1.12 \pm 0.60 \text{ (excludes ambiguous candidates)}$$

$$= 0.26 \pm 0.64 \text{ (all Gini-M20 candidates)}$$

(Lotz et al. 2008; see also Bundy et al 2004, 2005, de Propis et al 2005, Bell et al 2006, Ilbert et al 2006...)

Theory: Galaxy dynamics is predicated on the dynamics of dark matter

$$\Omega_{\text{matter}} = 0.2669 \pm 0.03 \quad \Omega_{\text{baryon}} = 0.0449 \pm 0.0028 \quad \Omega_{\text{dark energy}} = 0.734 \pm 0.029$$

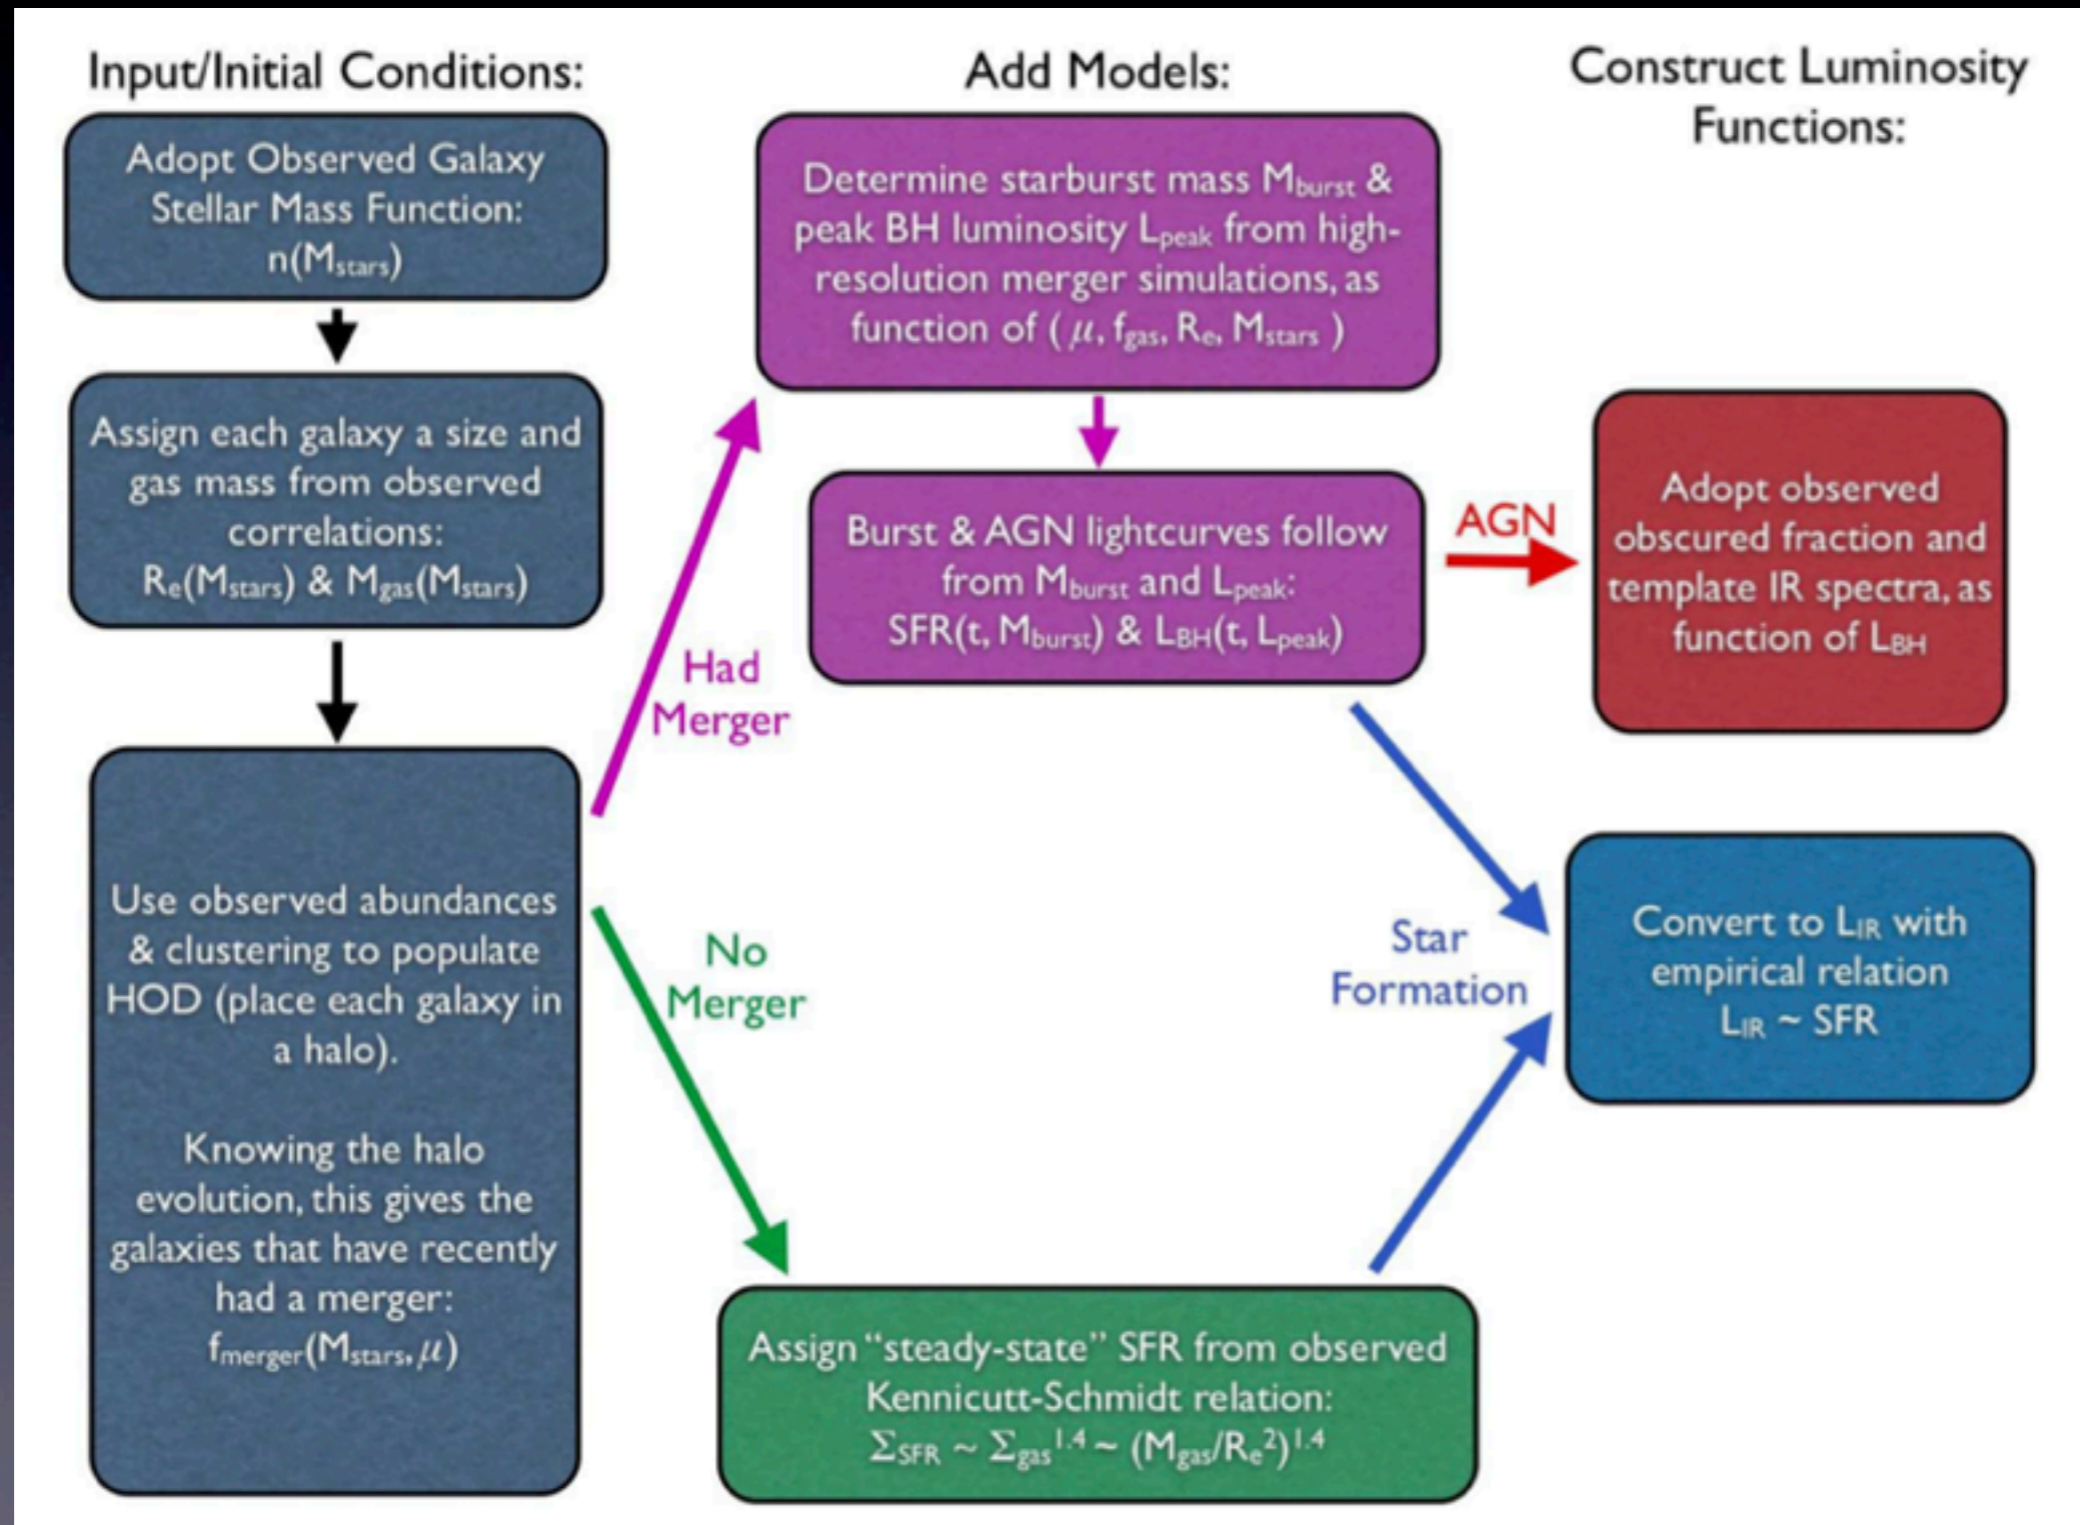

Problem: major halo merger \neq major galaxy mergers

Theory says that halo major merger rate $\sim (1+z)^3$
(Gottlober et al. 2001)

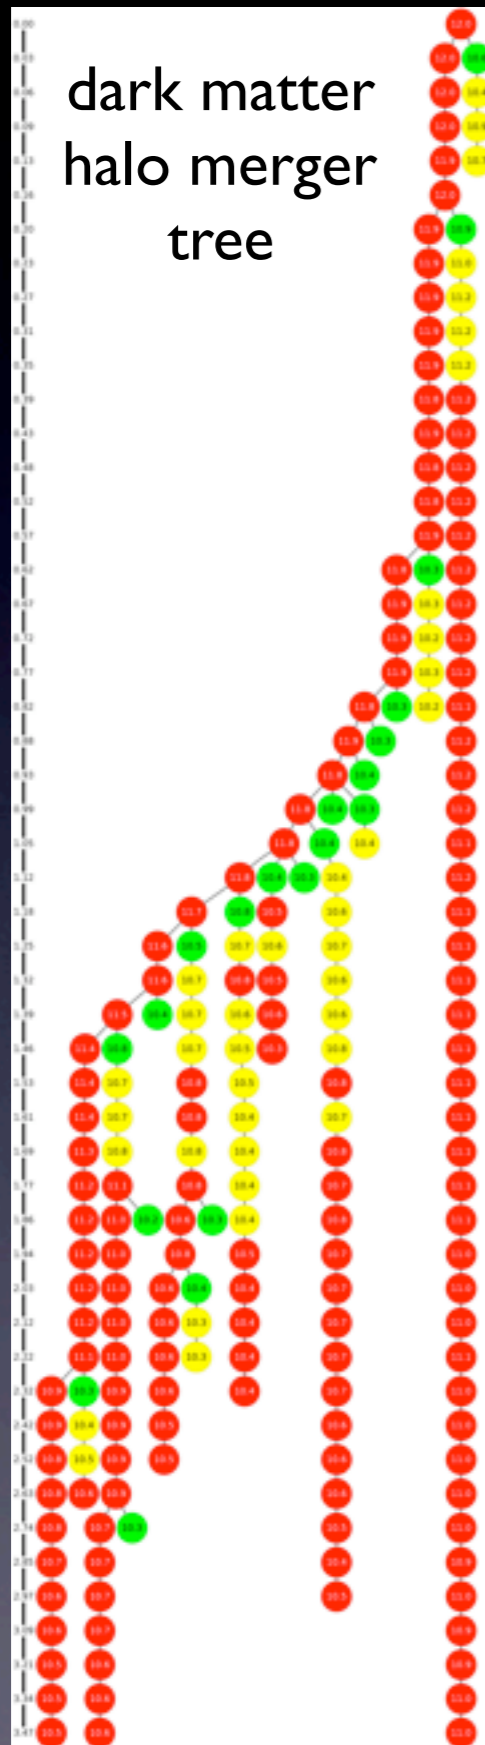

Galaxy merger rate from close pairs $\sim (1+z)^{0.5-1}$
(Berrier et al. 2006)

One way to connect galaxies to halos: Semi-Empirical Merger Models

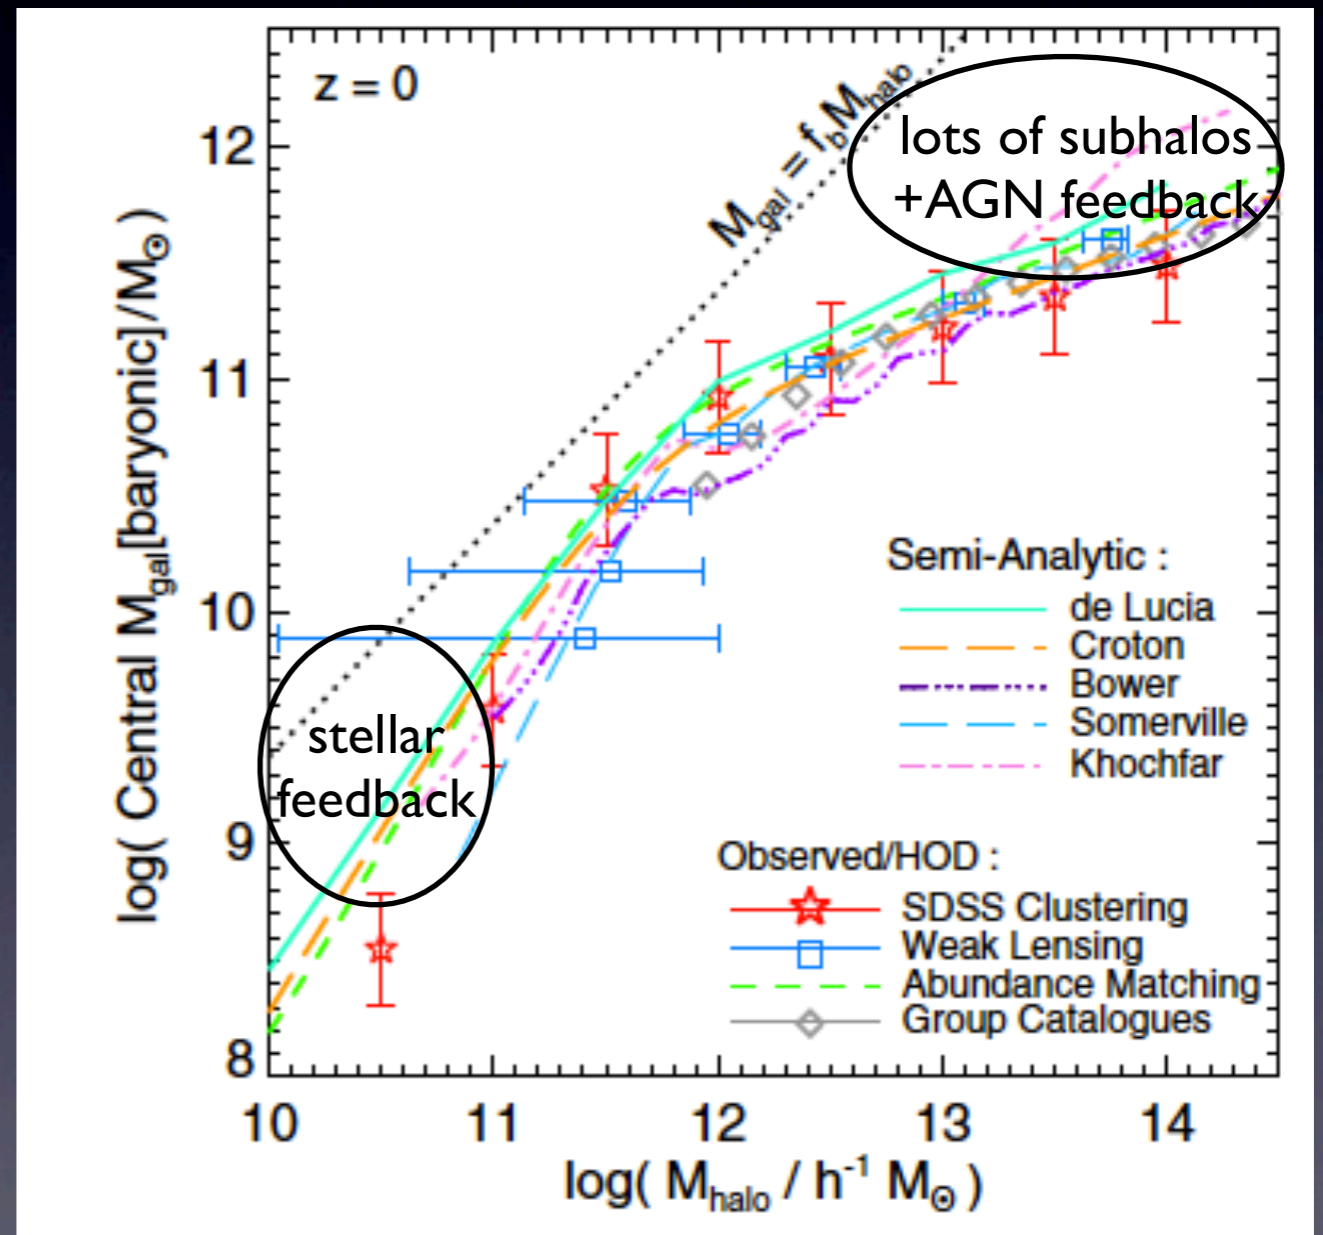

Hopkins et al. 2010 (Conroy & Wechsler 2009; Cooray 2006; Yan et al. 2003; Perez-Gonzalez et al. 2008; Wetzel et al. 2009; Stewart et al. 2009)

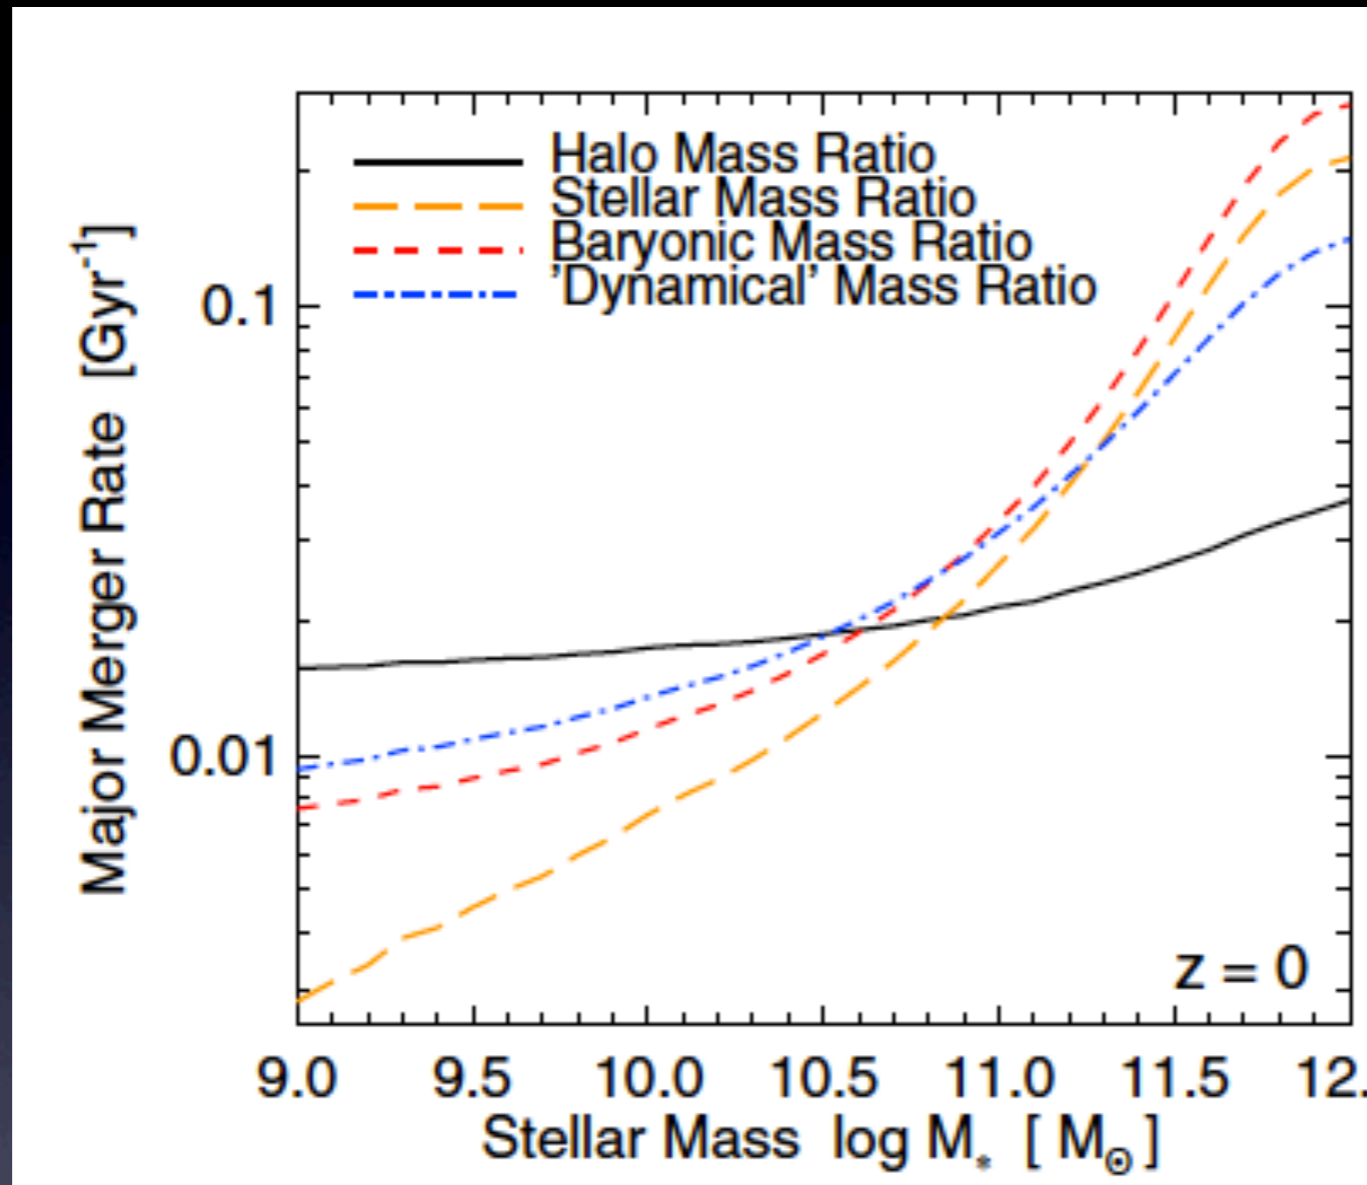

Let's walk through the prediction of galaxy merger rates

+

Beware! Major halo mergers aren't always major galaxy mergers (and vice versa!)

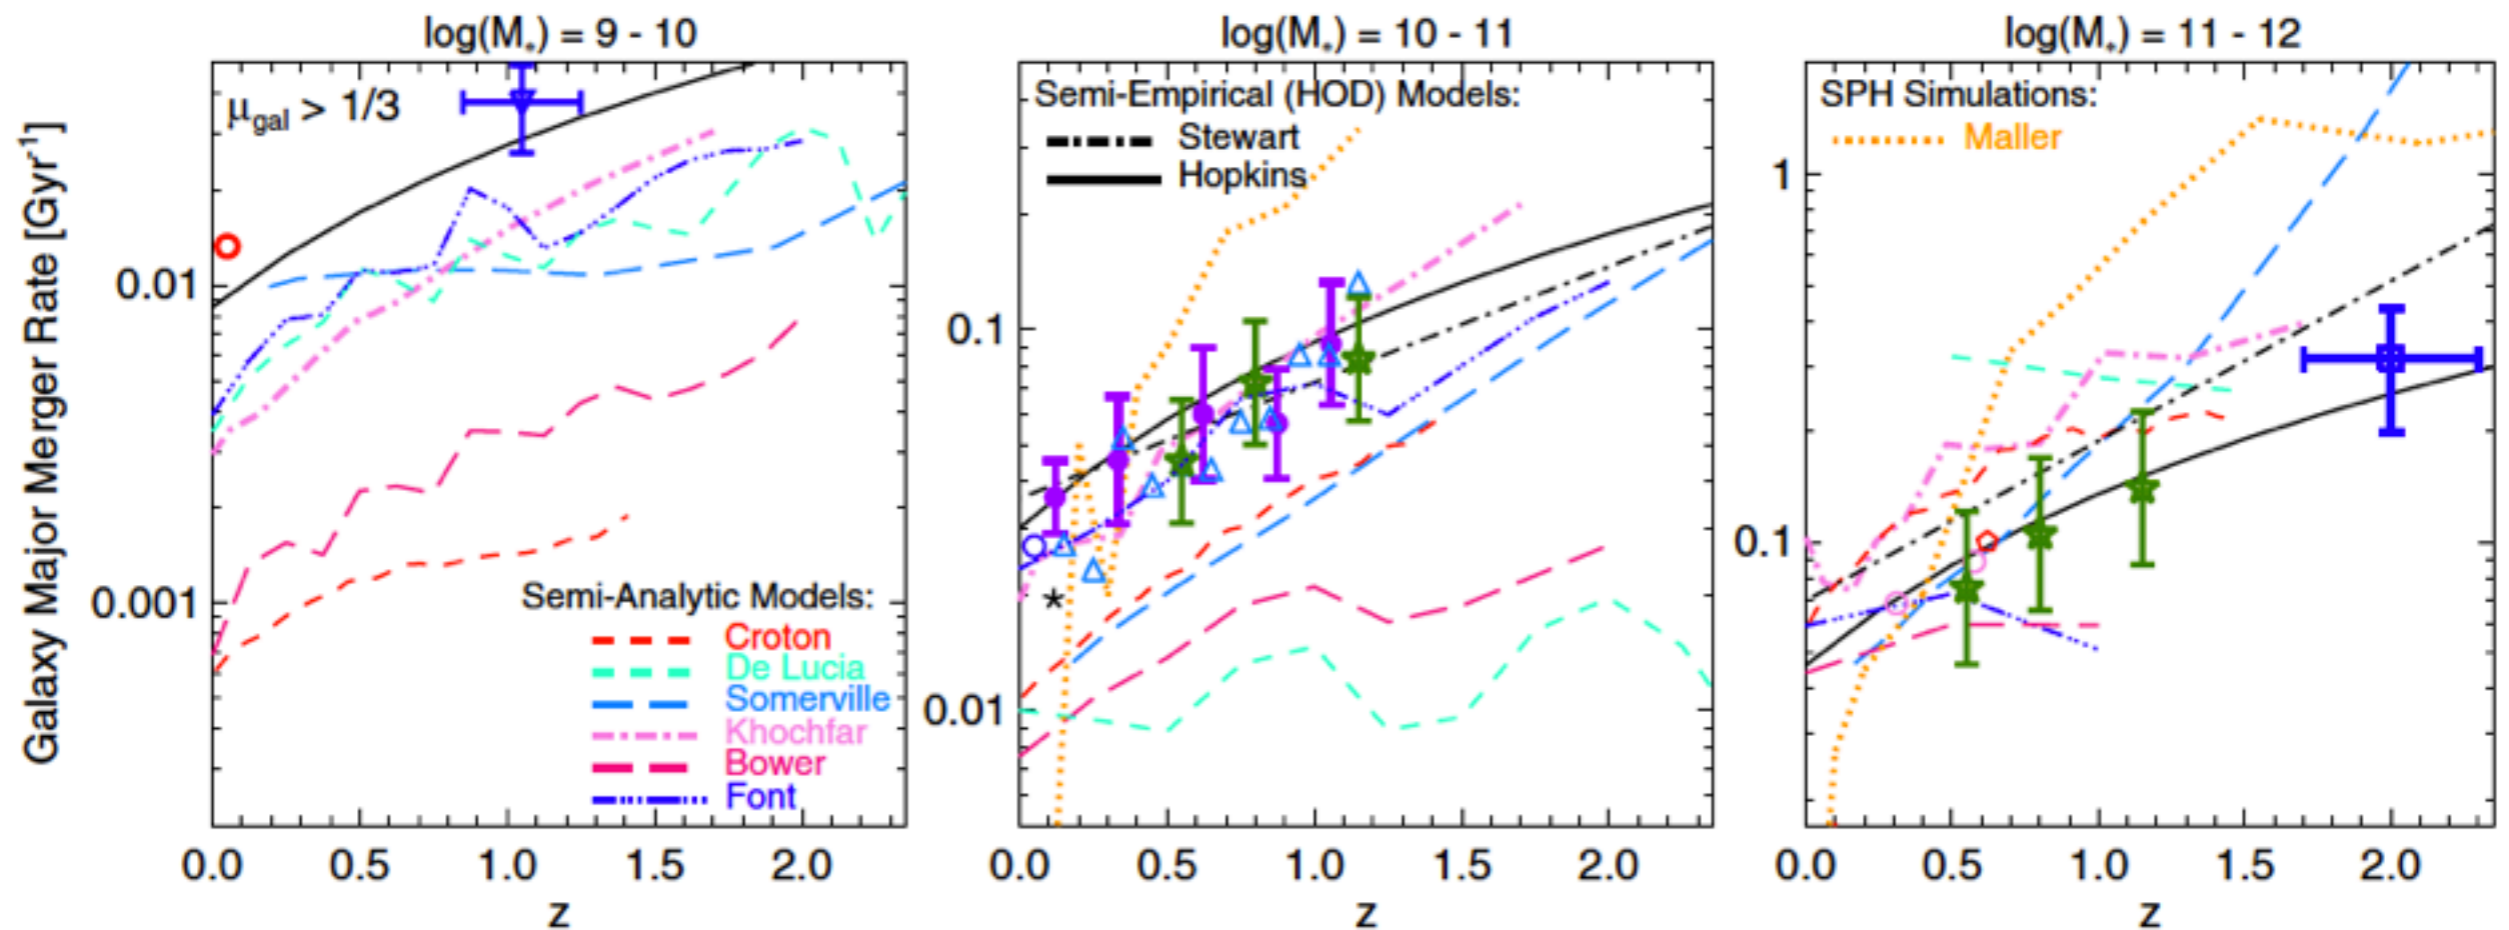

Here $M_* \propto M_{\text{halo}}^{0.5}$
so 1:9 halo merger is a
1:3 stellar merger

Here $M_* \propto M_{\text{halo}}^2$
so 1:3 halo merger is
a 1:9 stellar merger

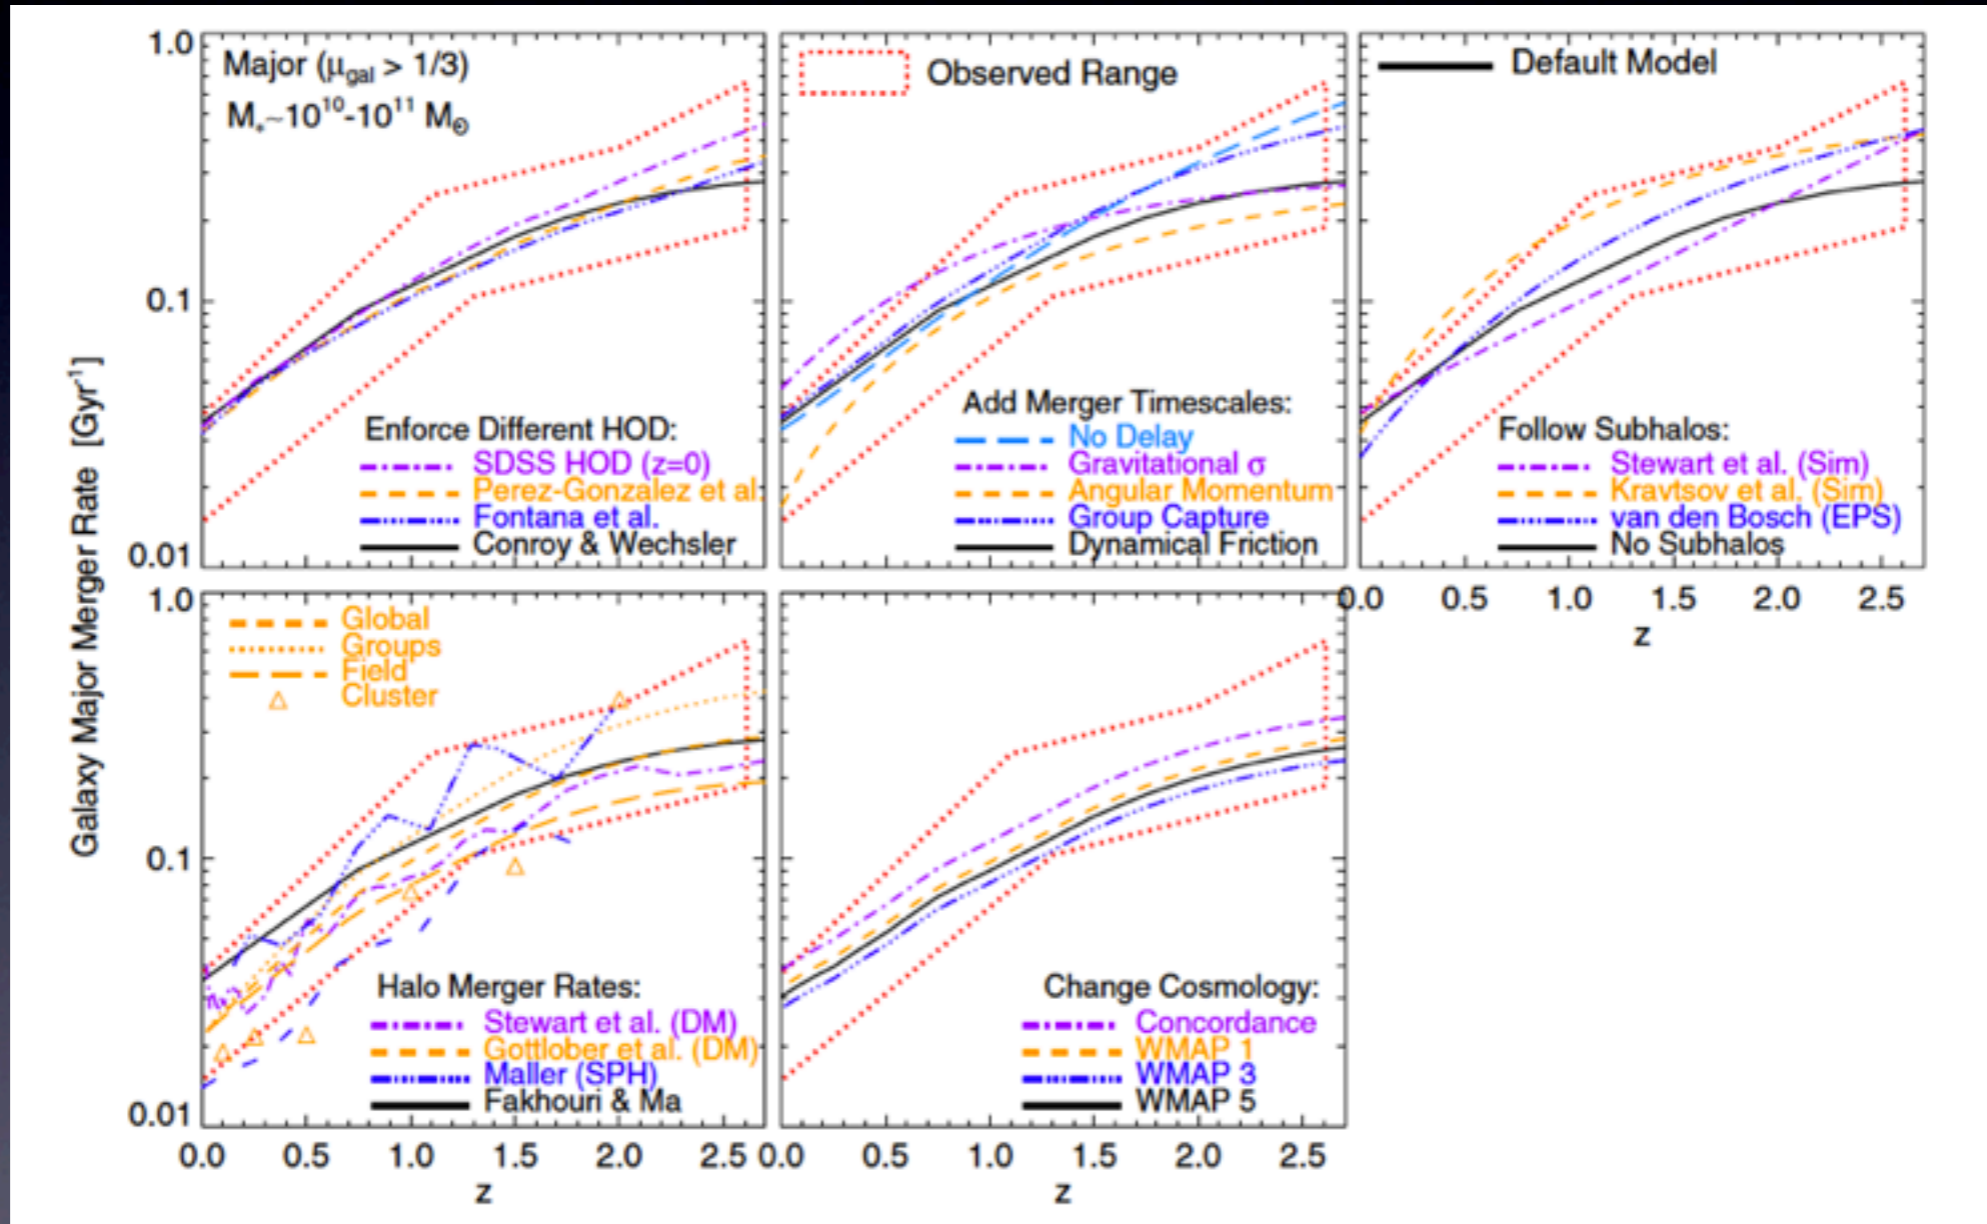

Recent semi-analytic models and high resolution SPH simulations fail to reproduce the evolution of the galaxy merger rate

Hopkins et al. 2011

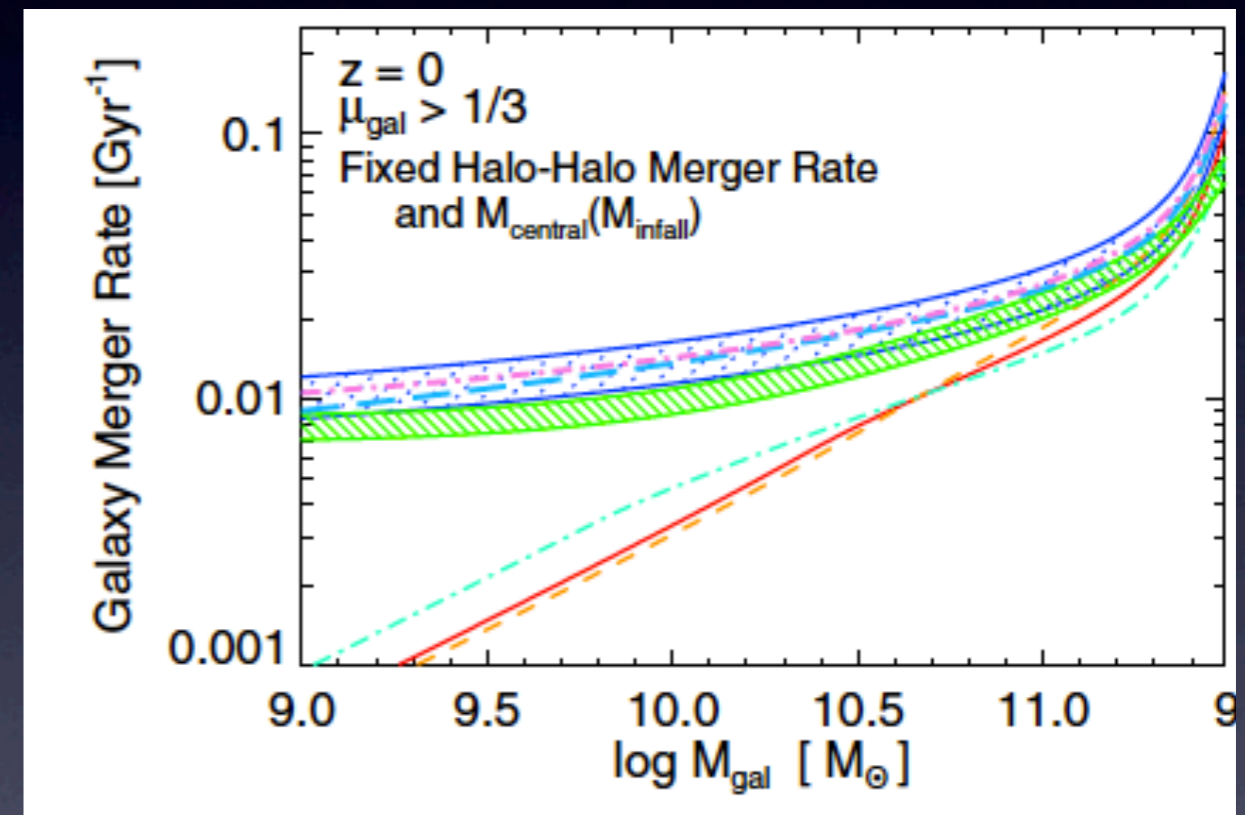

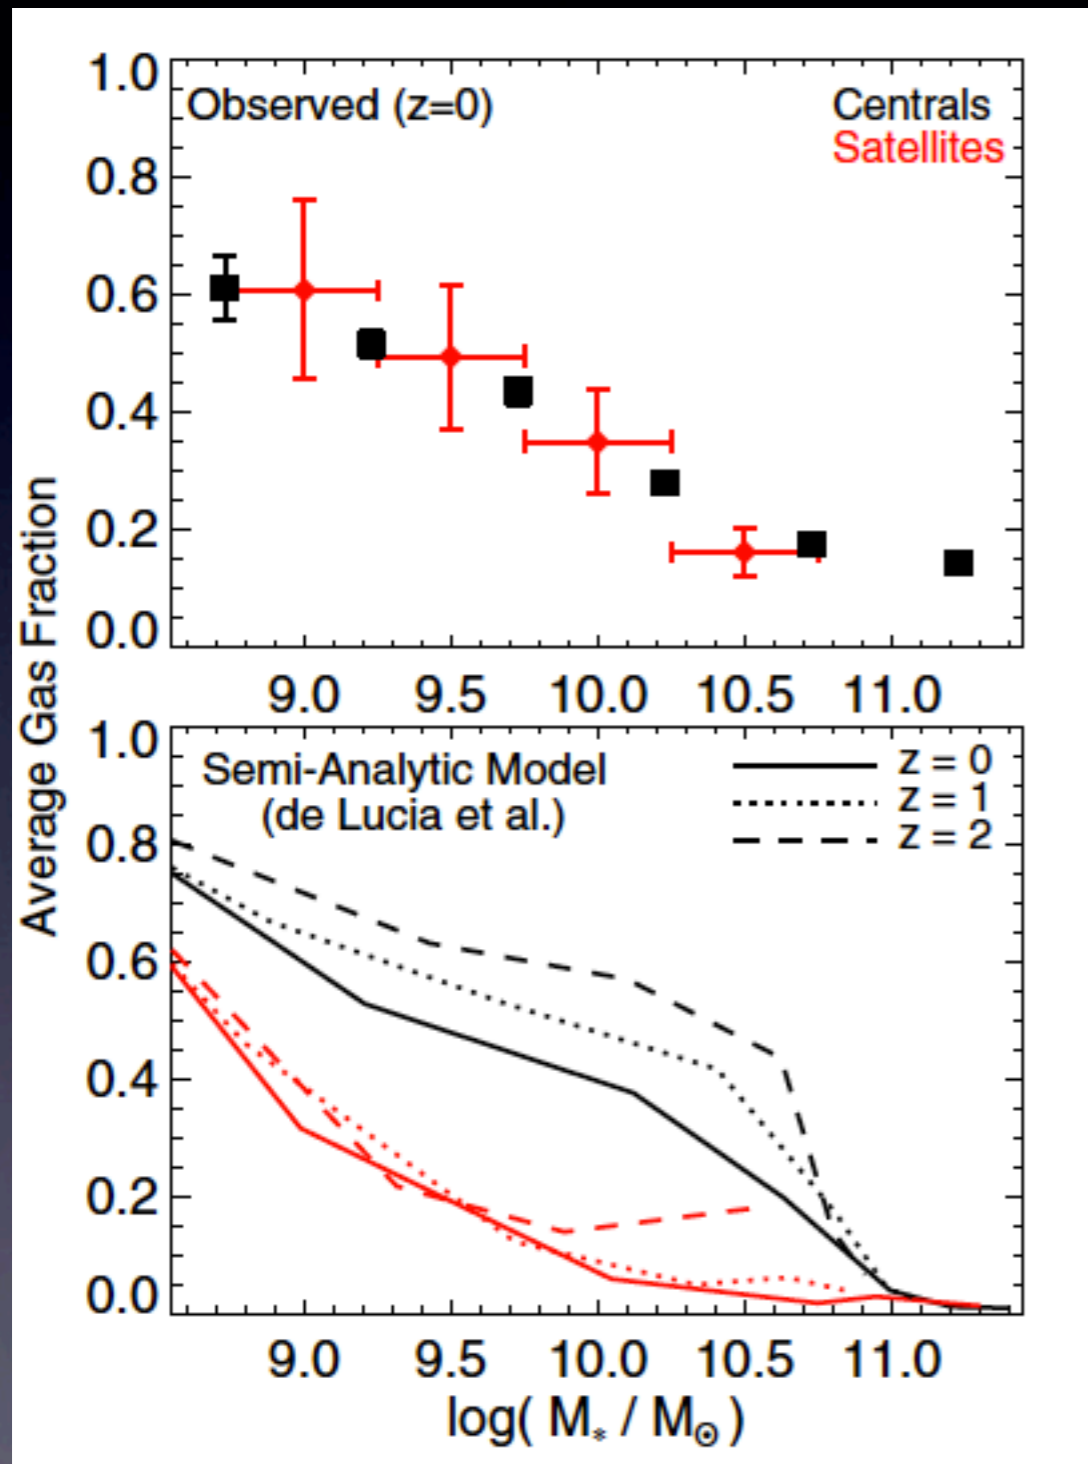

Kartalepe et al. 2007; Conselice et al. 2009; Lin et al. 2004, 2008; Xu et al. 2004, 2008; De Propriis et al. 2005; Bluck et al. 2009; Bundy et al. 2009; Bell et al. 2006a,b

Changing the way you deal with dark matter/ gravitational dynamics contributes to a factor of ~2 uncertainty in galaxy merger rates

'Overquenching' the gas in satellite galaxies makes the biggest difference in galaxy merger rates

Another approach: using high resolution
SPH simulations of galaxy mergers to better
inform the semi-analytical models

these were sbcr_hr_f_stars_c.mov and (next slide)
the gas counterpart but stupid keynote=too big

What we learn: major mergers don't quench the 'satellite'

Here:

Radiation pressure
imparts momentum
to gas

Stellar winds from
young and old stars

Photo-ionization
heats the gas

Supernovae deposits
energy and vents to
the IGM

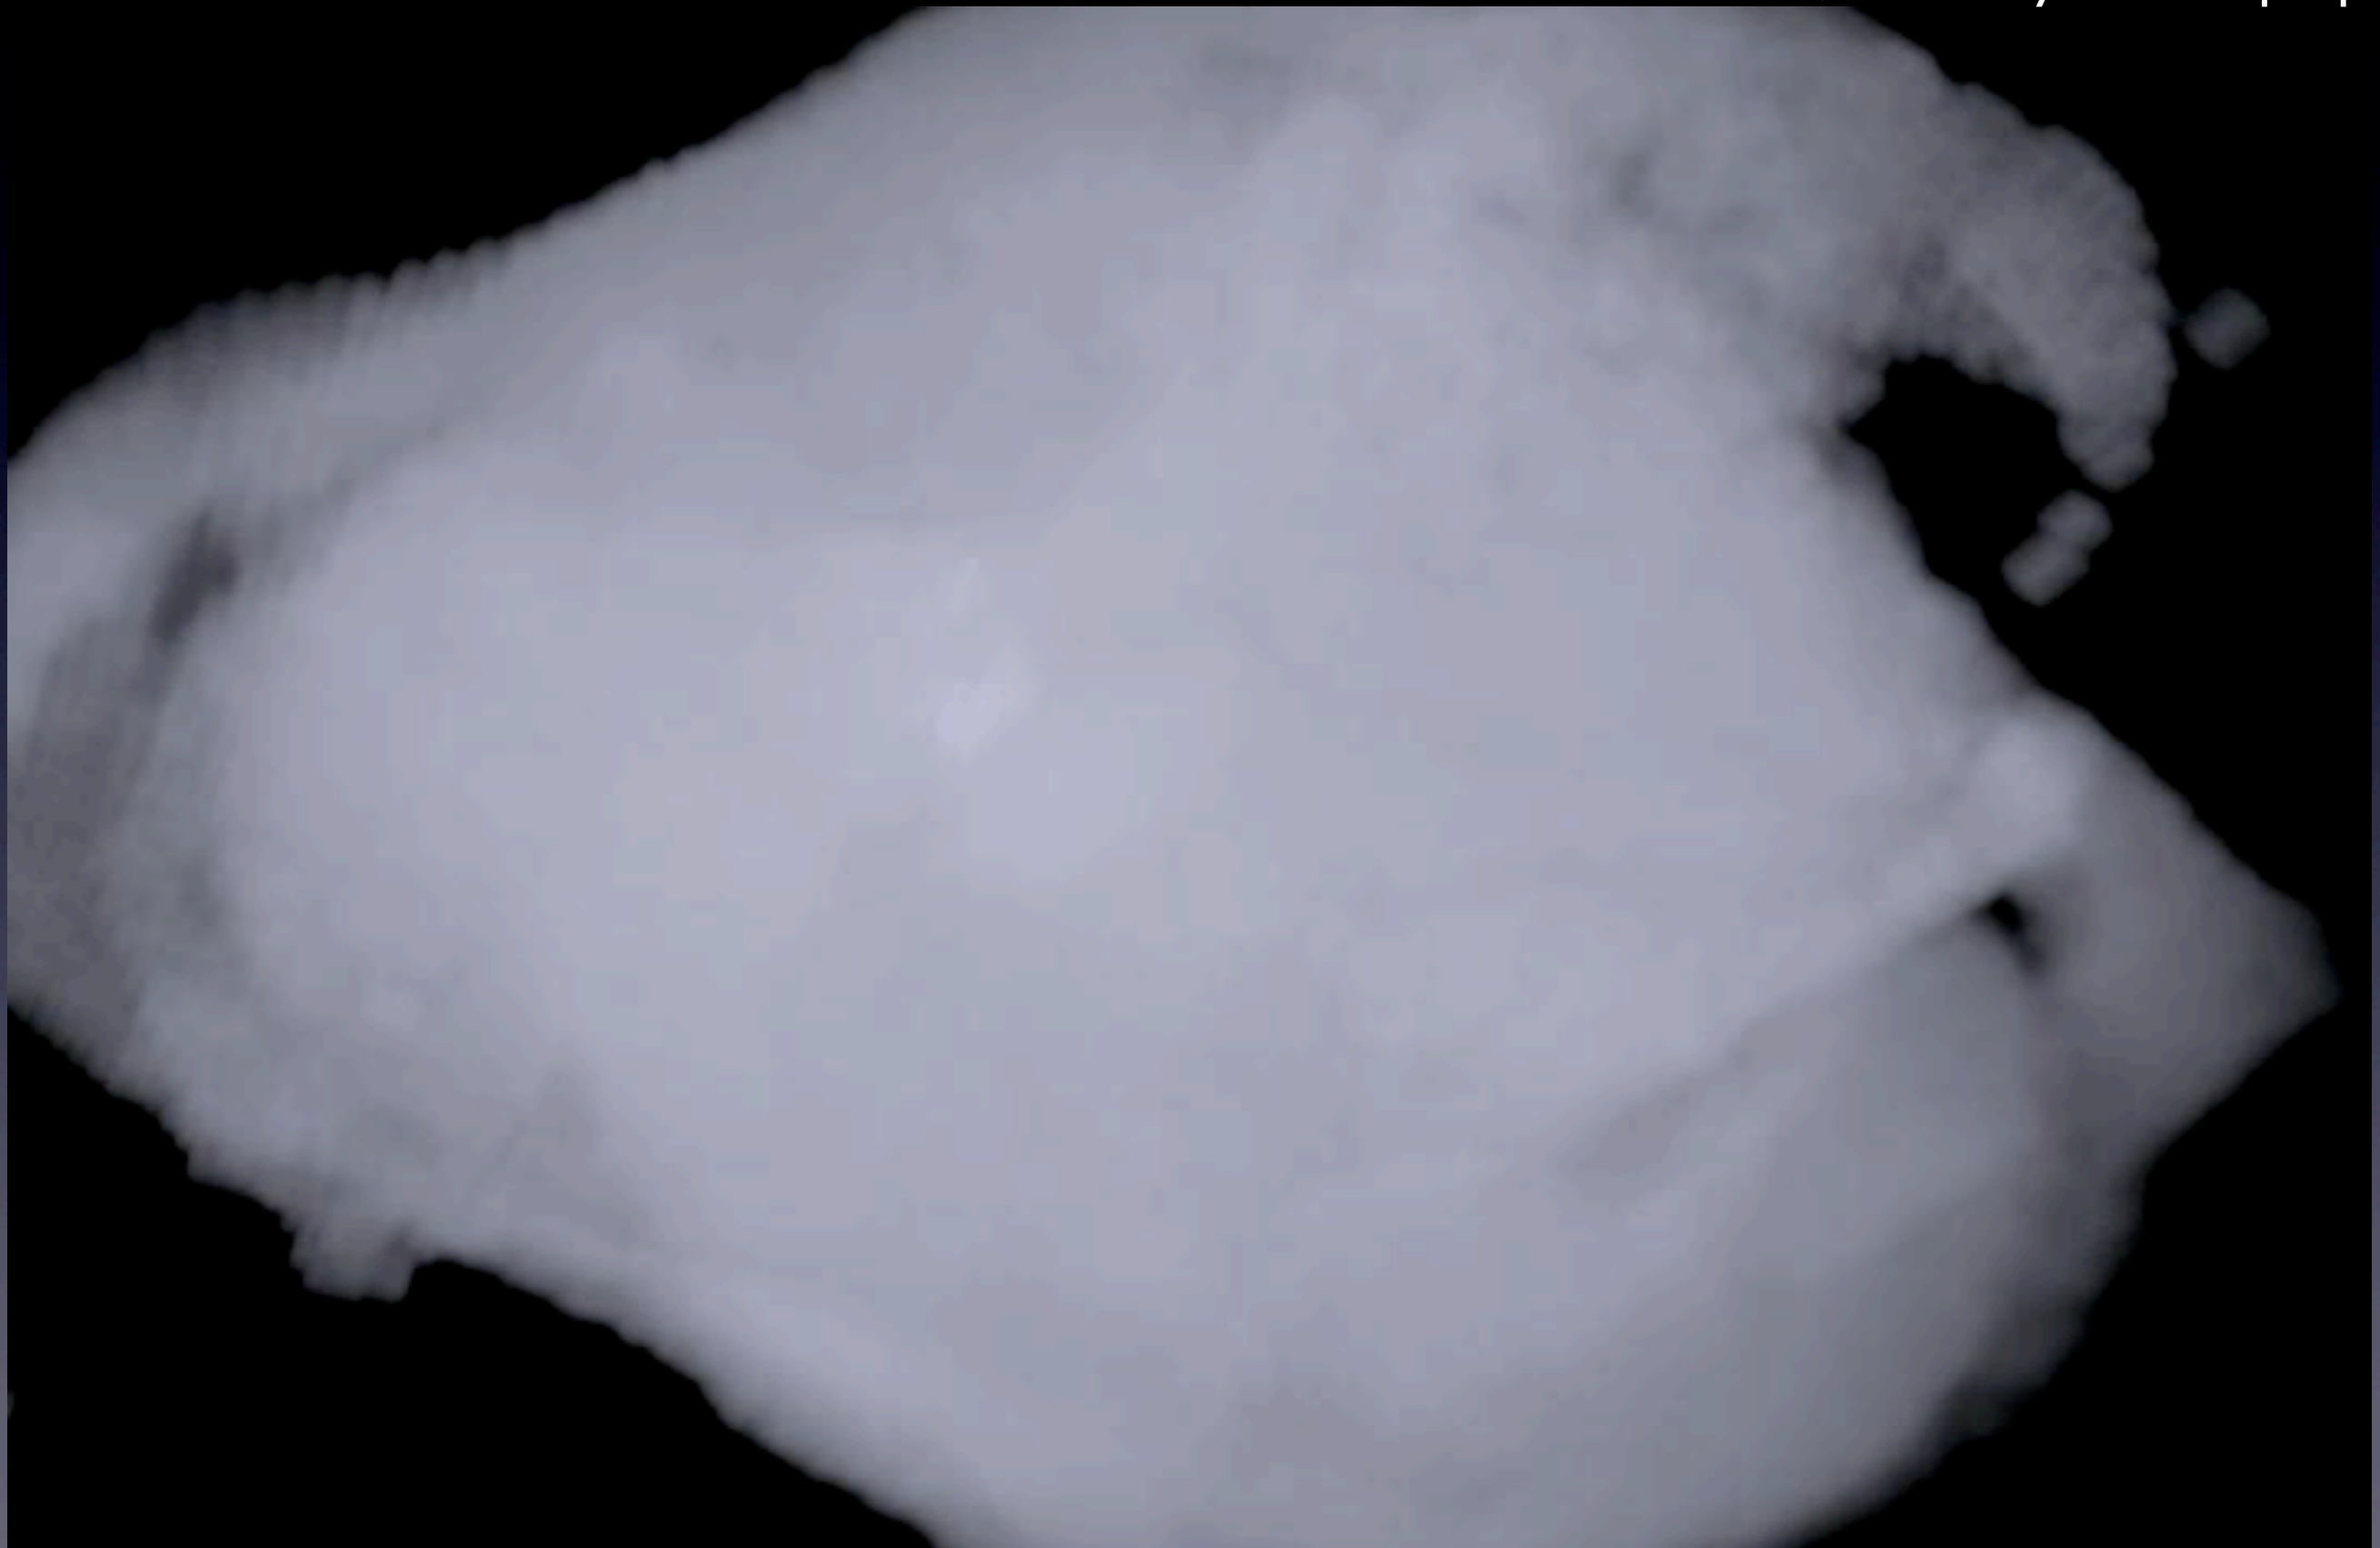

Hopkins et al. 2011

What we learn: 'Cold' Flow accretion feeds the galaxy and satellite well into the merger

Keres et al. 2005; Bellovary et al. in prep.

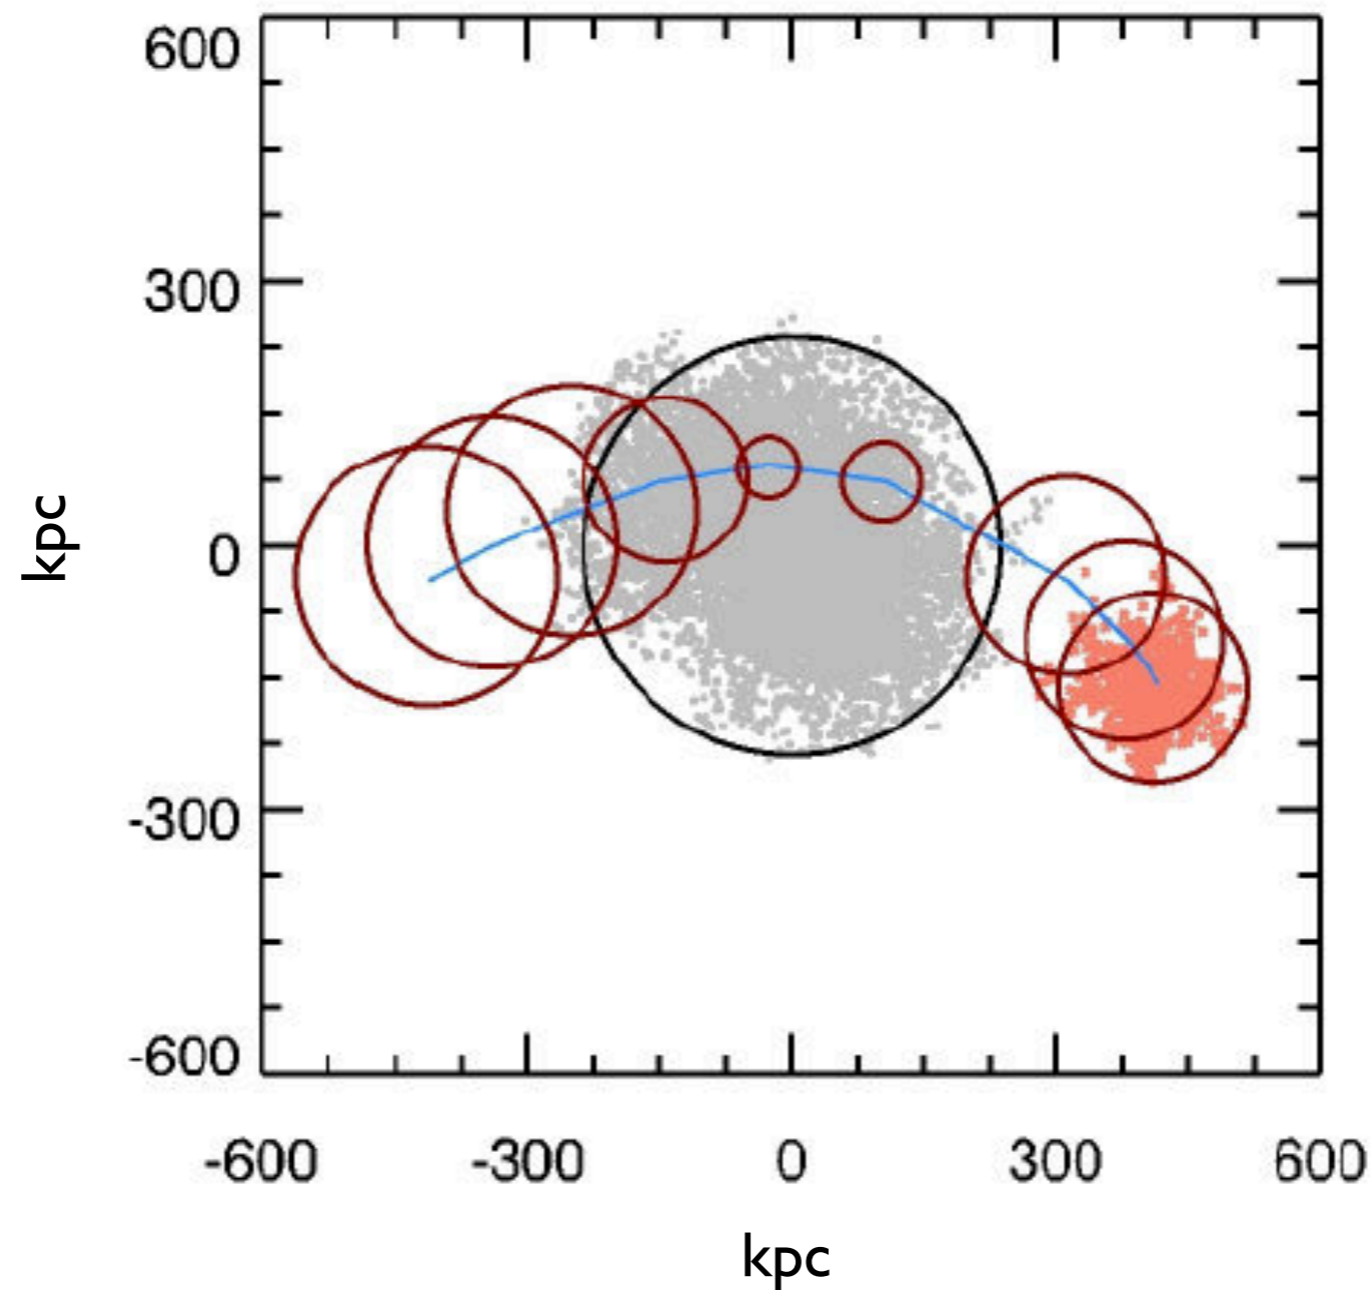

What we learn: 'Cold' Flow accretion feeds the galaxy and satellite well into the merger

Keres et al. 2005; Bellovary et al. in prep.

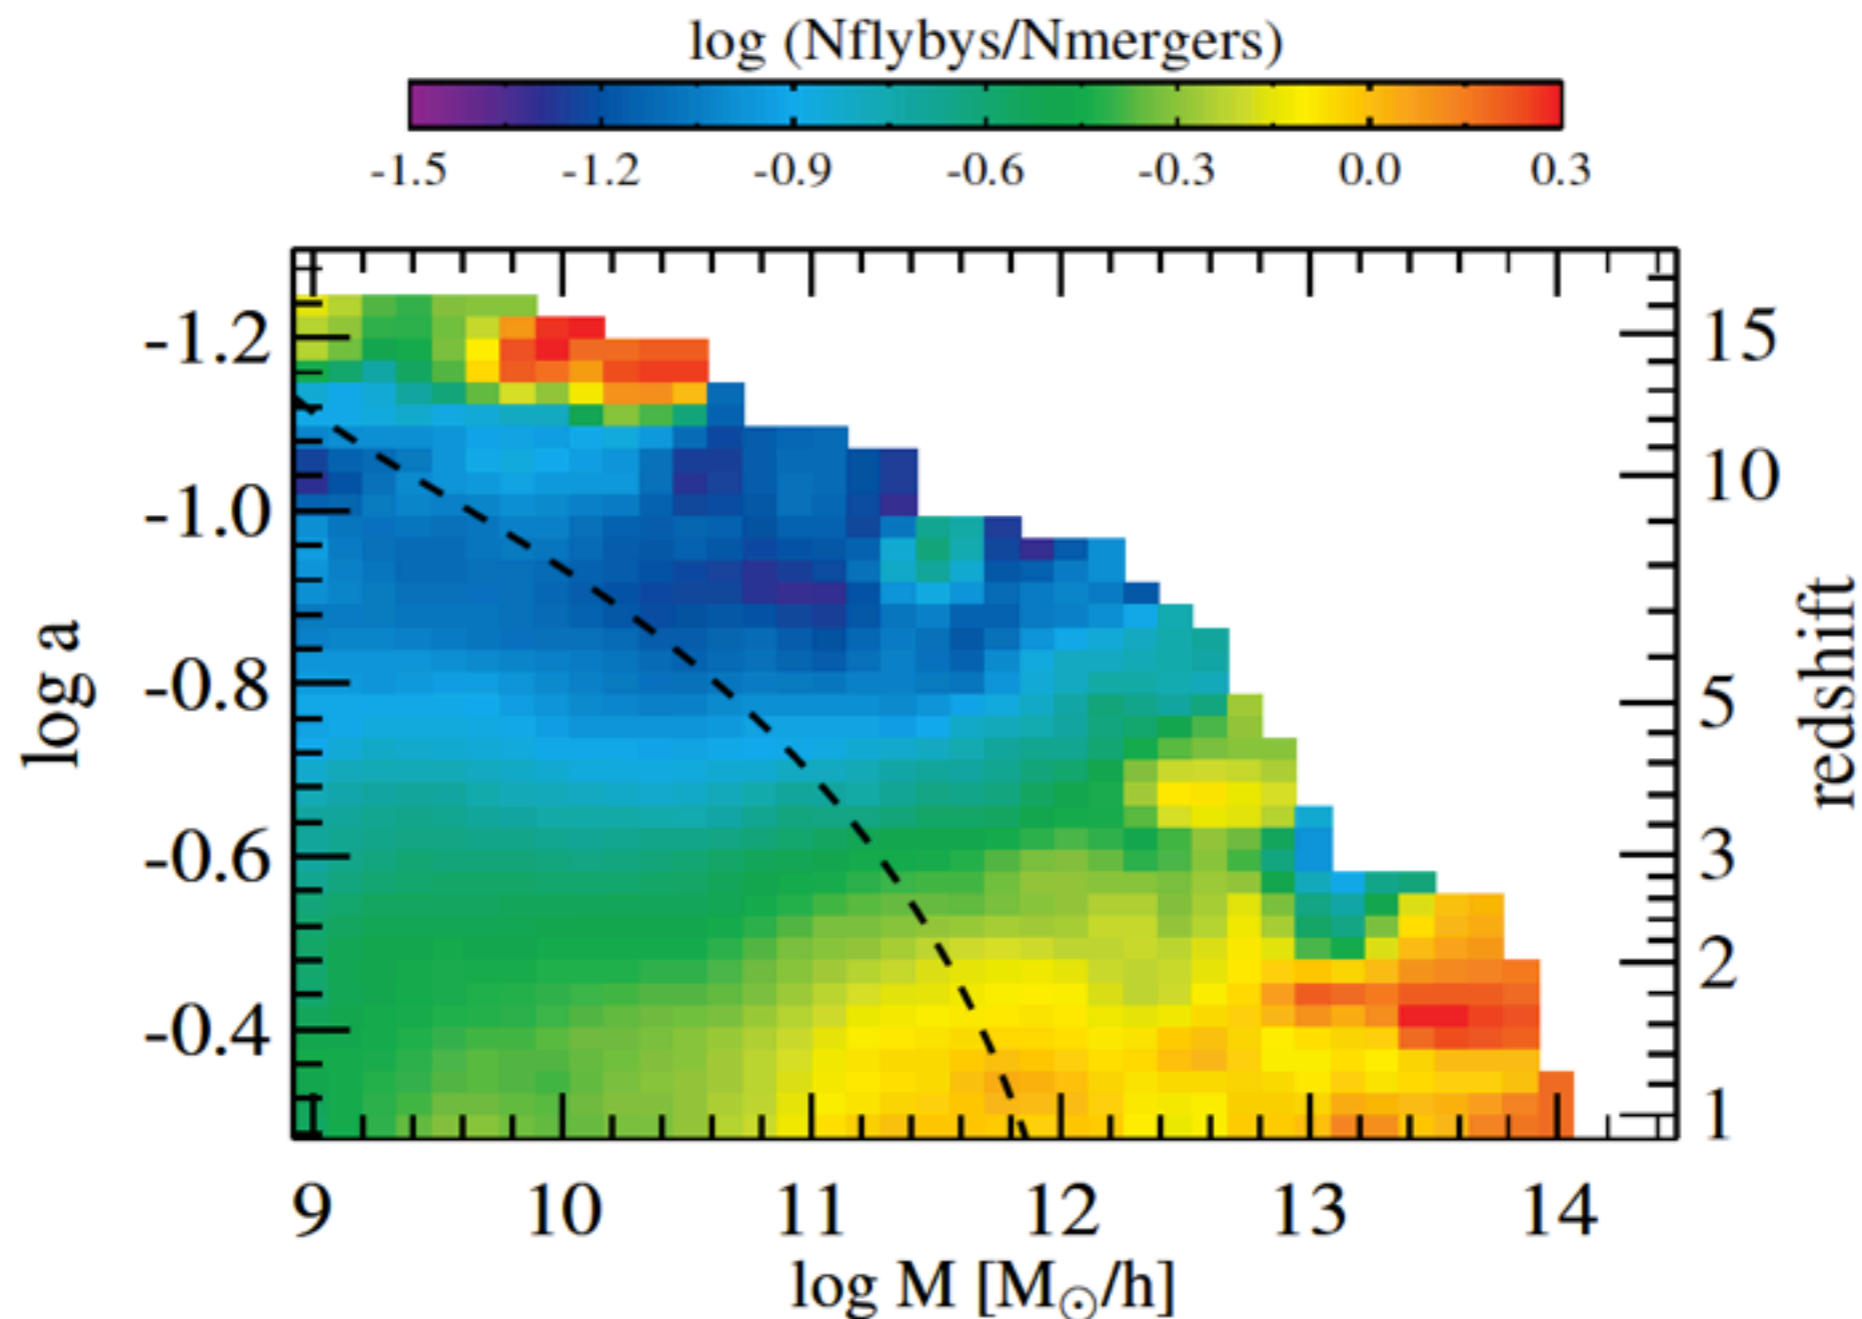

Cautionary note: Galaxy Flybys may matter

Sinha + KHB 2012

Flyby encounters can happen just as often as mergers -- *currently ignored in hierarchical growth scenarios*

Sinha + KHB 2012

Why this matters: galaxy flybys can strongly perturb the galaxy

Vesperini+Weinberg 2001

Mayer et al 2011

...which can funnel gas to the center, excite star formation, may feed the SMBH...

Why this matters: galaxy flybys can strongly perturb the galaxy

Vesperini+Weinberg 2001

Mayer et al 2011

...which can funnel gas to the center, excite star formation, may feed the SMBH...

Recap: Finding the major galaxy merger rate is a subtle business

- Though major **halo** mergers strongly increase with redshift, major **galaxy** merger evolution is more modest.
- At $z=0$, major **halo** mergers depend weakly on halo mass, but major **galaxy** mergers occur $\sim 10x$ more often for massive galaxies.
- To match the observed galaxy merger rate, the biggest error source is in removing the satellite baryons.
- Flybys/Cold mode accretion may be important/neglected mechanism for galaxy transformation.

That's all folks!!

Thanks!
