

# Feedback-Regulated Star Formation (Stellar & AGN Feedback: Now with Physics!)

Philip Hopkins

Norm Murray, Eliot Quataert,  
Lars Hernquist, Todd Thompson, Dusan Keres, Chris Hayward, Stijn Wuyts,  
Kevin Bundy, Desika Narayanan, Ryan Hickox, Rachel Somerville, & more

Tuesday, December 25, 12

# Q: WHY IS STAR FORMATION SO INEFFICIENT?

# A: Stellar Feedback!

## SO WHAT'S THE PROBLEM?

- Standard (in Galaxy Formation):  
Couple SNe energy  
as “heating”/thermal energy

- FAILS:

$$t_{\text{cool}} \sim 4000 \text{ yr} \left( \frac{n}{\text{cm}^{-3}} \right)^{-1}$$

$$t_{\text{dyn}} \sim 10^8 \text{ yr} \left( \frac{n}{\text{cm}^{-3}} \right)^{-1/2}$$

- “Cheat”:

- Turn off cooling
- Force wind by hand  
(‘kick’ out of galaxy)

make really ~1  
min

# Stellar Feedback: How Can We Do Better?

## Stellar Feedback: How Can We Do Better?

- High-resolution ( $\sim 1\text{pc}$ ), molecular cooling ( $<100\text{ K}$ ), SF only at highest densities ( $n_{\text{H}} > 1000\text{ cm}^{-3}$ )

# Stellar Feedback: How Can We Do Better?

- High-resolution ( $\sim 1\text{pc}$ ), molecular cooling ( $<100\text{ K}$ ), SF only at highest densities ( $n_{\text{H}} > 1000\text{ cm}^{-3}$ )
- Heating:
  - SNe (II & Ia)
  - Stellar Winds
  - Photoionization (HII Regions)

# Stellar Feedback: How Can We Do Better?

- High-resolution ( $\sim 1\text{pc}$ ), molecular cooling ( $<100\text{ K}$ ), SF only at highest densities ( $n_{\text{H}} > 1000\text{ cm}^{-3}$ )
- Heating:
  - SNe (II & Ia)
  - Stellar Winds
  - Photoionization (HII Regions)

- *Explicit* Momentum Flux:

- Radiation Pressure

$$\dot{P}_{\text{rad}} \sim \frac{L}{c} (1 + \tau_{\text{IR}})$$

- SNe

$$\dot{P}_{\text{SNe}} \sim \dot{E}_{\text{SNe}} v_{\text{ejecta}}^{-1}$$

- Stellar Winds

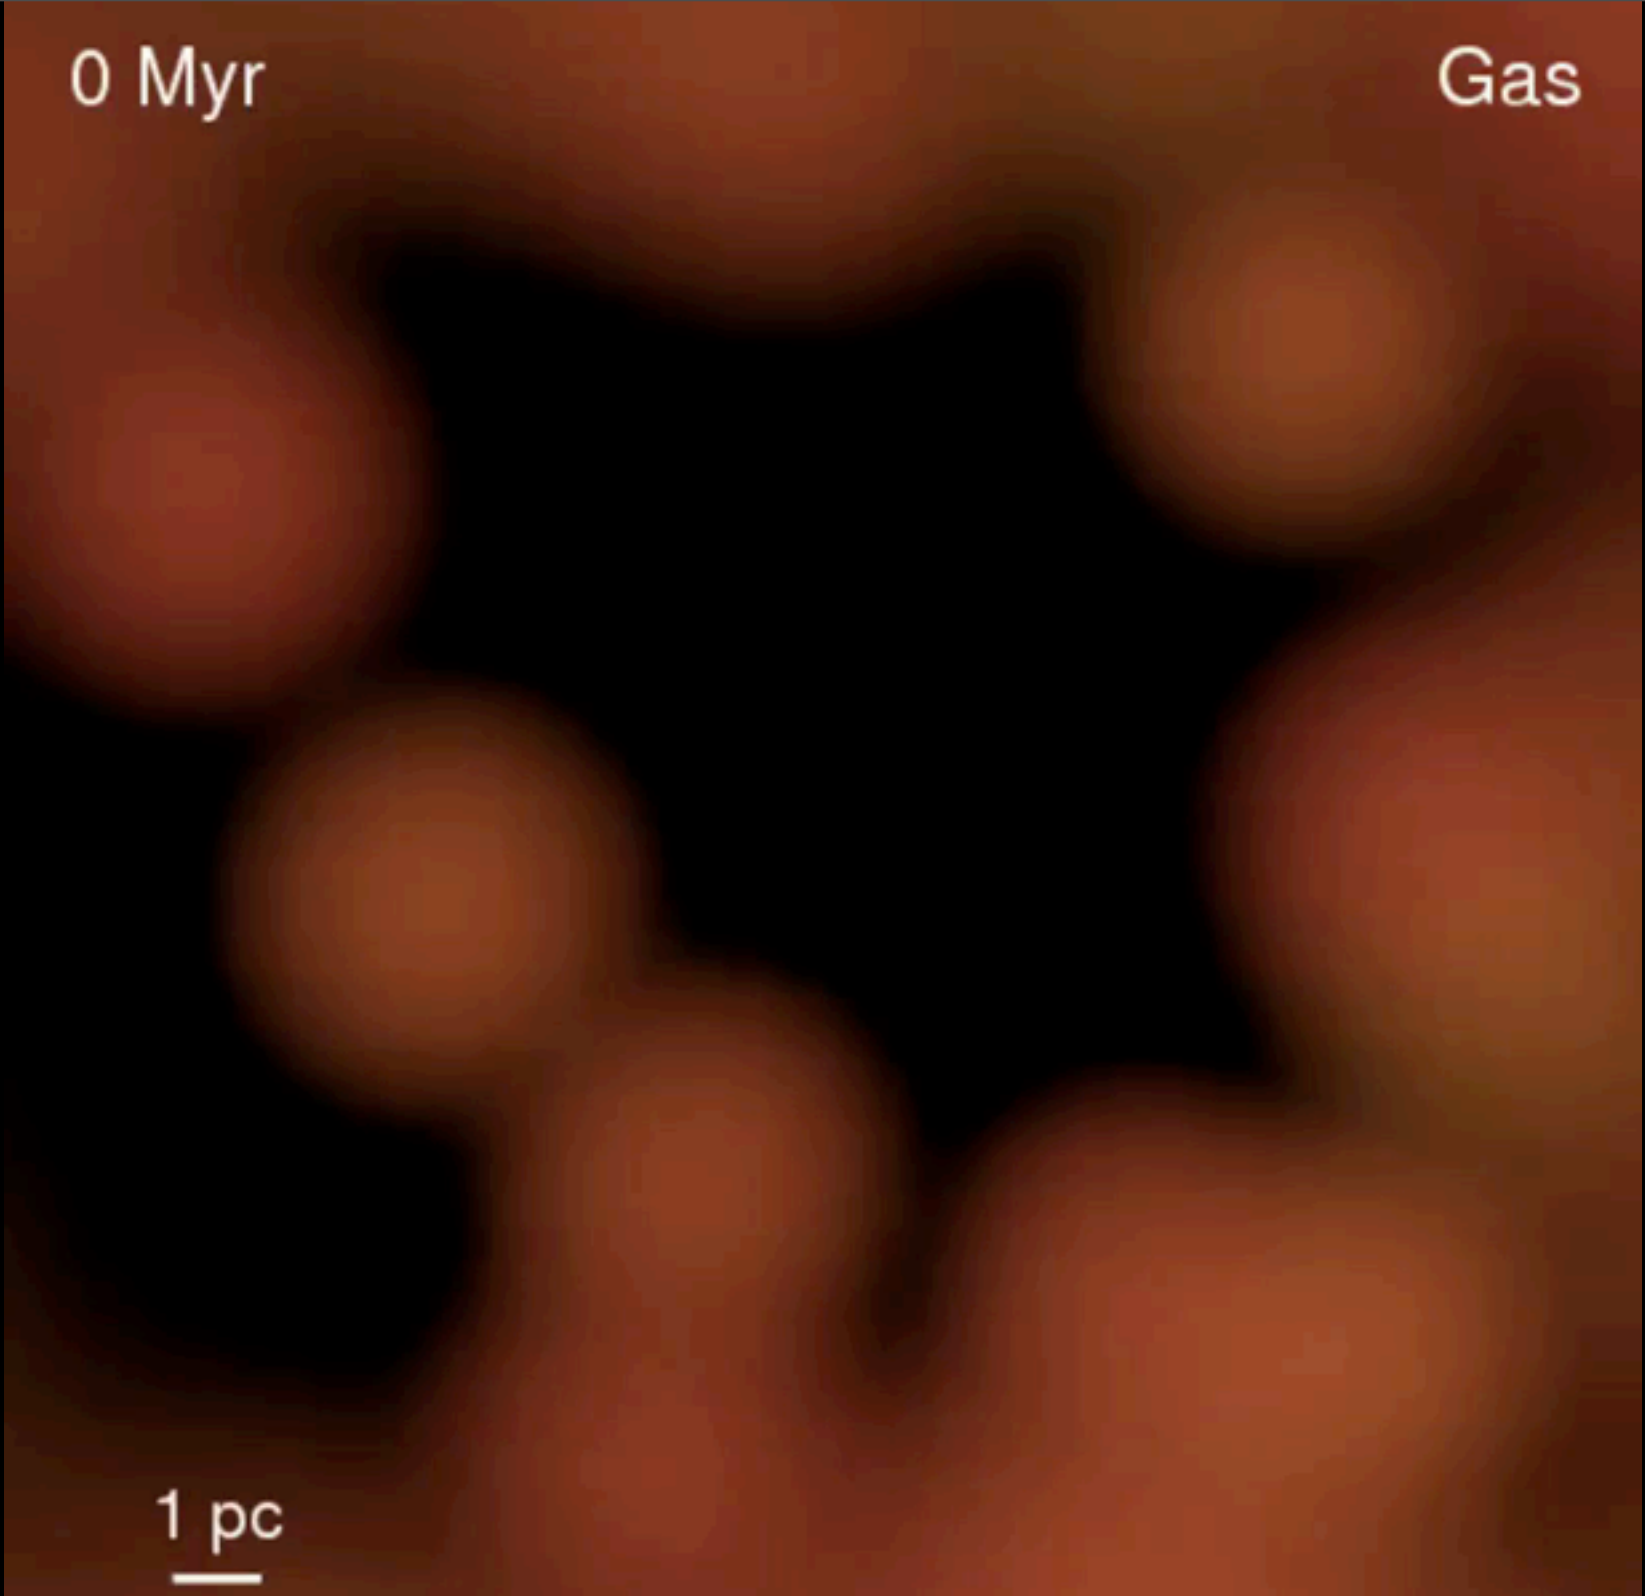

$$\dot{P}_{\text{W}} \sim \dot{M} v_{\text{wind}}$$

## WHICH MECHANISMS MATTER?

➤  $\text{SFR} \sim 100+ M_{\text{sun}}/\text{yr}$   
( $L \sim L_{\text{EDD}}$ )

➤ Optically thick

➤  $\langle n \rangle \sim 100 \text{ cm}^{-3}$   
 $T_{\text{cool}} \sim 1000 \text{ yr}$

# Stellar Feedback & Self-Regulation

## WHICH MECHANISMS MATTER?

➤  $\text{SFR} \sim 0.01 M_{\text{sun}}/\text{yr}$   
( $L \ll L_{\text{EDD}}$ )

➤ Optically thin

➤  $\langle n \rangle \sim 0.1 \text{ cm}^{-3}$   
 $T_{\text{cool}} \sim \text{Myr}$

# Kennicutt-Schmidt relation emerges naturally

# Global Star Formation Rates are *INDEPENDENT* of High-Density SF Law

Hopkins, Quataert, & Murray 2011  
also Saitoh et al. 2008

# Global Star Formation Rates are *INDEPENDENT* of High-Density SF Law

- Set by feedback (i.e. SFR) needed to maintain marginal stability

Hopkins, Quataert, & Murray 2011

$$\dot{M}_{\text{wind}} \approx 10 \dot{M}_{*} \left( \frac{V_c}{100 \text{ km s}^{-1}} \right)^{-1.1} \left( \frac{\Sigma_{\text{gas}}}{10 M_{\odot} \text{ pc}^{-2}} \right)^{-0.5}$$

# Future Directions

## WHAT CAN WE EXPLORE WITH MORE REALISTIC ISM/FEEDBACK MODELS?

- Mergers:
  - Star cluster formation? Starburst environments?
- AGN Feedback:
  - How does it couple to a multi-phase ISM?
- Cosmological simulations:
  - “Zoom-in” disk formation simulations (D. Keres)
  - Cosmological volume AMR: dwarf populations and mass function evolution (M. Kuhlen)
- GMCs & ISM Structure:
  - Formation & destruction of GMCs, lifetimes, star formation efficiencies

~30 sec

# What About The Quasars?

- BALs:  
Preferentially in high-L quasars
- Covering factor  $\sim 20\%$
- of  $\sim 16$  measured, 14 have:

$$\dot{M}_{\text{wind}} v \gtrsim L_{\text{AGN}}/c$$
$$L_{\text{wind}} \gtrsim 0.01 L_{\text{AGN}}$$

$$R_{\text{wind}} \sim 1 - 20 \text{ kpc}$$

$$v \gtrsim 1000 \text{ km s}^{-1}$$

$$\dot{M}_{\text{wind}} \sim 100 - 600 M_{\odot} \text{ yr}^{-1}$$

## Bars w/in Bars

(Shlosman et al. 1989)

“It’s Bars all the Way Down ...”

## Bars w/in Bars

(Shlosman et al. 1989)

“It’s Bars all the Way Down ...”

$$\dot{M} \approx 10 M_{\odot} \text{ yr}^{-1} \left( \frac{\text{Disk}}{\text{Total}} \right)^{5/2} M_{\text{BH}, 8}^{-1/6} M_{\text{gas}, 9} R_{0,100}^{-3/2}$$

## Bars w/in Bars

(Shlosman et al. 1989)

“It’s Bars all the Way Down ...”

More accurately ...

“It’s Non-axisymmetric Features all the Way Down ...”

$$\dot{M} \approx 10 M_{\odot} \text{ yr}^{-1} \left( \frac{\text{Disk}}{\text{Total}} \right)^{5/2} M_{\text{BH}, 8}^{-1/6} M_{\text{gas}, 9} R_{0,100}^{-3/2}$$

## Step 2: Feedback

- $L/L_{\text{Edd}} > \sim 0.1$
- Covering factor  $\sim 10\text{-}30\%$

- Launched at  $< \text{pc}$

$$\dot{M}_{\text{launch}} \sim \dot{M}_{\text{BH}}$$

$$v_{\text{launch}} \sim 30,000 \text{ km/s}$$

Proga et al. 00-07; Kurosawa et al. 08-11

z

z

R

No BAL Winds

With BAL Winds

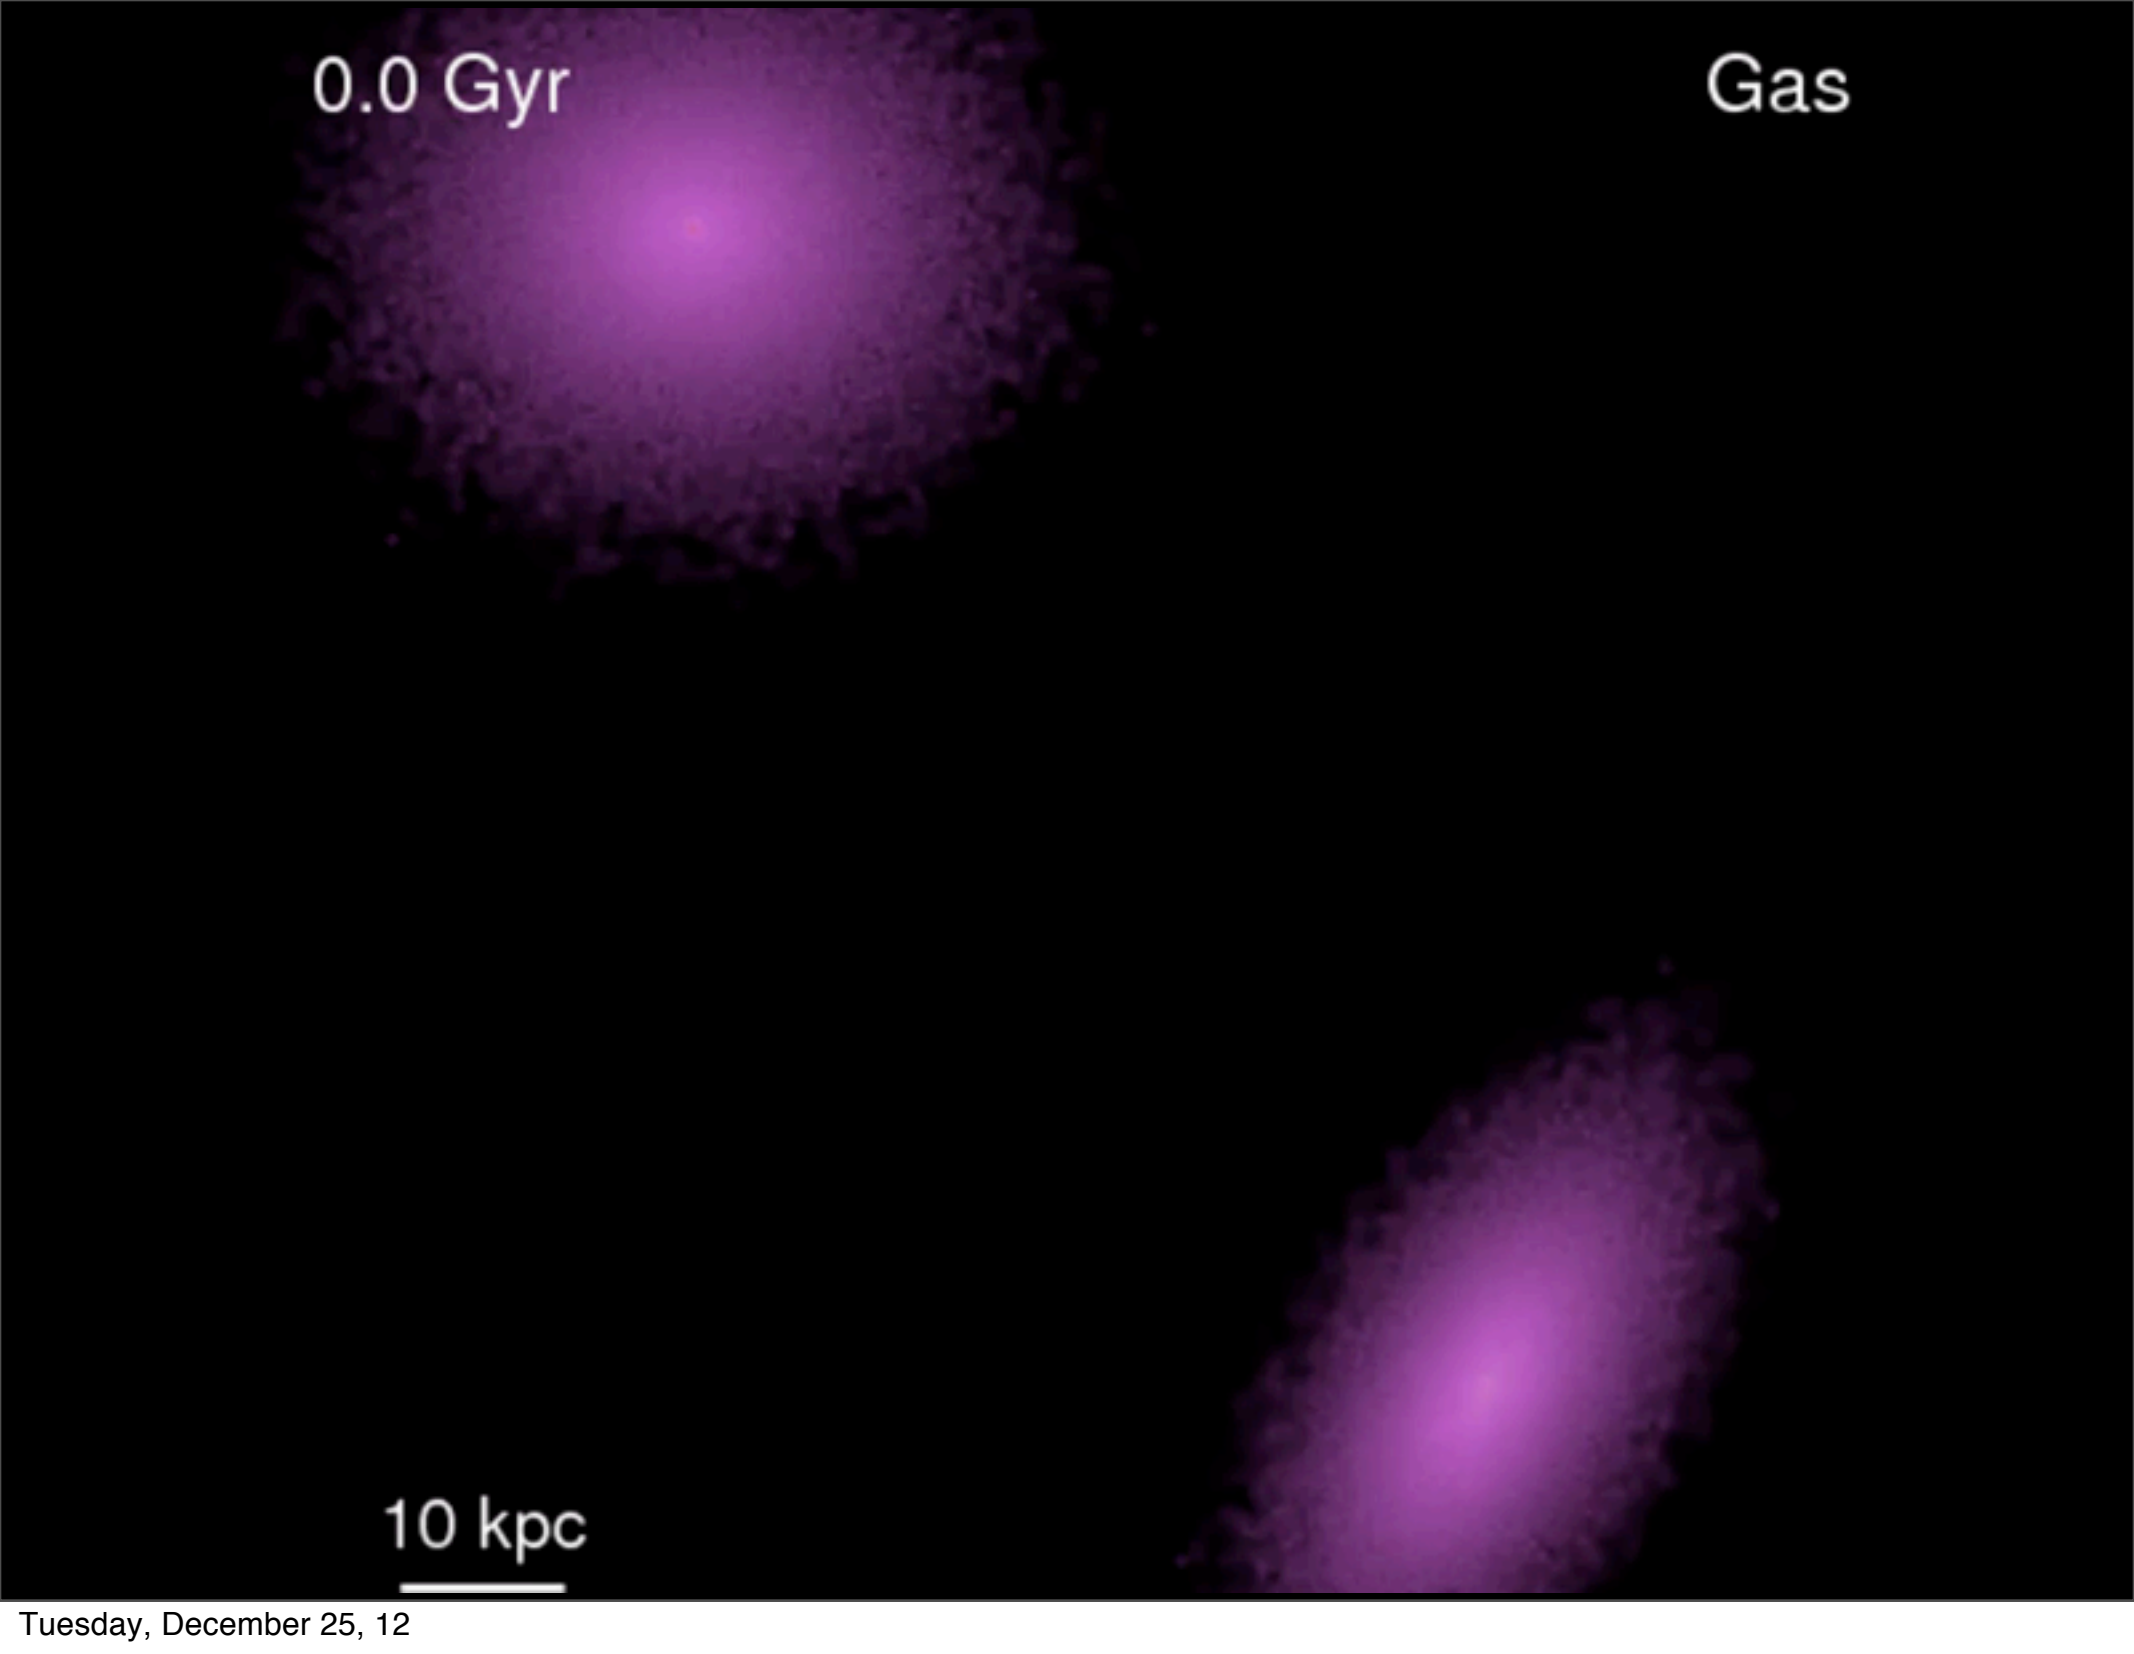

$$\dot{M}_{\text{launch}}(0.1 \text{ pc}) = 0.5 \dot{M}_{\text{BH}}$$

$$v_{\text{launch}}(0.1 \text{ pc}) = 10,000 \text{ km/s}$$

# Do we still need 'Quasar Mode' Feedback?

# Do we still need ‘Quasar Mode’ Feedback?

### Step 3: Profit

CAN IT REALLY AFFECT STAR FORMATION?

Novak et al. 2010,11

Debuhr, Ma, Quataert 2010,11

- Recover M-s
  - Normalization  $\sim (\text{efficiency})^{-1}$
- Launch  $\sim 1000$  km/s “tail” in winds
- Suppress SFR

# Summary:

- **Global Star formation is Feedback-Regulated:** *independent* of small-scale SF ‘law’
  - Need ‘enough’ stars to offset dissipation (set by gravity)

- Feedback leads to Kennicutt relation & super-winds:

$$\dot{M}_{\text{wind}} \approx 10 \dot{M}_* \left( \frac{V_c}{100 \text{ km s}^{-1}} \right)^{-1.1} \left( \frac{\Sigma_{\text{gas}}}{10 M_{\odot} \text{ pc}^{-2}} \right)^{-0.5}$$

Standing!

- Different mechanisms dominate different regimes:

- High densities: radiation pressure
- Intermediate: HII heating, stellar wind momentum
- Low densities: SNe & stellar wind shock-heating
  - **No *one* mechanism works**

- Quasar feedback is here to stay:

- BAL Winds:
  - CAN explain  $M_{\text{BH-S}}$
  - WILL suppress SFRs
  - SHOULD heat & help clear IGM & Proto-Group Environments

- Inflows: “Stuff within Stuff”: Cascade of instabilities with diverse morphology

$$\dot{M}_{\text{BH}} \propto f(\text{B/T}) M_{\text{gas}}(R)/t_{\text{dyn}}$$
