U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 1 / 90

Overview

- Motivation
- Modeling black holes in GR
- Black holes in astrophysics
- Black holes in fundamental physics
 - Trans Planckian scattering
 - Non-assymptotically flat boundaries: AdS/CFT
- Other topics in $D \ge 5$
 - Instabilities of Myers-Perry BHs
 - Cosmic censorship in $D \ge 5$
- Summary

U. Sperhake (CSIC-IEEC)

What are black holes?

- Consider Lightcones
- In and outgoing light
- Calculate surface of outgoing light fronts
- Expansion ≡ Rate of change of this surface

- Apparent Horizon \equiv Outermost surface with zero expansion
- "Light cones tip over" due to curvature

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 4 / 90

Black holes are out there: Stellar BHs

high-mass X-ray binaries: Cygnus X-1 (1964)

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

09/12/2010 5 / 90

Black holes are out there: Stellar BHs

• One member is very compact and massive \Rightarrow Black Hole

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

09/12/2010 6 / 90

Black holes are out there: galactic BHs

- Supermassive BHs found at center of virtually all galaxies
- SMBHs conjectured to be responsible for quasars starting in the 1980s

The Centre of the Milky Way (VLT YEPUN + NACO) 0European Southern Observatory

Black holes might be in here: LHC

LHC CERN

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

09/12/2010 8 / 9

Motivation (AdS/CFT correspondence)

 BH spacetimes "know" about physics without BHs AdS/CFT correspondence Maldacena '97

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

09/12/2010 9 / 90

2. Modeling black holes in GR

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 10 / 9

General Relativity: Curvature

• Curvature generates acceleration

"geodesic deviation" No "force"!!

Description of geometry

Metric	$oldsymbol{g}_{lphaeta}$
Connection	$\Gamma^{lpha}_{eta\gamma}$
Riemann Tensor	${\cal R}^{lpha}{}_{eta\gamma\delta}$

・ コ ト ・ 雪 ト ・ ヨ ト ・

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 11 / 9

The metric defines everything

Christoffel connection

$$\Gamma^{lpha}_{eta\gamma}=rac{1}{2}m{g}^{lpha\mu}\left(\partial_{eta}m{g}_{\gamma\mu}+\partial_{\gamma}m{g}_{\mueta}-\partial_{\mu}m{g}_{eta\gamma}
ight)$$

Covariant derivative

$$\nabla_{\alpha}T^{\beta}{}_{\gamma} = \partial_{\alpha}T^{\beta}{}_{\gamma} + \Gamma^{\beta}_{\mu\alpha}T^{\mu}{}_{\gamma} - \Gamma^{\mu}_{\gamma\alpha}T^{\beta}{}_{\mu}$$

Riemann Tensor

$$\mathcal{R}^{\alpha}{}_{\beta\gamma\delta} = \partial_{\gamma} \Gamma^{\alpha}_{\beta\delta} - \partial_{\delta} \Gamma^{\alpha}_{\beta\gamma} + \Gamma^{\alpha}_{\mu\gamma} \Gamma^{\mu}_{\beta\delta} - \Gamma^{\alpha}_{\mu\delta} \Gamma^{\mu}_{\beta\gamma}$$

→ Geodesic deviation,
 Parallel transport,

. . .

イロト イポト イヨト イヨト

How to get the metric?

Train cemetery Uyuni, Bolivia

(a)

• Solve for the metric $g_{\alpha\beta}$

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 13 / 9

How to get the metric?

- The metric must obey the Einstein Equations
- Ricci-Tensor, Einstein Tensor, Matter Tensor
 - $egin{aligned} & R_{lphaeta} \equiv R^{\mu}{}_{lpha\mueta} \ & G_{lphaeta} rac{1}{2}g_{lphaeta}R^{\mu}{}_{\mu} & ext{``Trace reversed'' Ricci} \ & T_{lphaeta} & ext{``Matter''} \end{aligned}$
- Einstein Equations $G_{\alpha\beta} =$
- Solutions: Easy! Tal
- $G_{\alpha\beta} = 8\pi T_{\alpha\beta}$
 - Take metric
 - \Rightarrow Calculate $G_{\alpha\beta}$
 - \Rightarrow Use that as matter tensor
- Physically meaningful solutions: Difficult!

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 14 / 90

The Einstein Equations in vacuum

- "Spacetime tells matter how to move, matter tells spacetime how to curve"
- Field equations in vacuum: $R_{\alpha\beta} = 0$ Second order PDEs for the metric components Invariant under coordinate (gauge) transformations
- System of equations extremely complex: Pile of paper! Analytic solutions: Minkowski, Schwarzschild, Kerr, Robertson-Walker, ...
- Numerical methods necessary for general scenarios!!!

・ロット (雪) (日) (日) 日

A list of tasks

- Target: Predict time evolution of BBH in GR
- Einstein equations: 1) Cast as evolution system

2) Choose specific formulation

3) Discretize for computer

- Choose coordinate conditions: Gauge
- Fix technical aspects: 1) Mesh refinement / spectral domains

2) Singularity handling / excision

3) Parallelization

- Construct realistic initial data
- Start evolution and waaaaiiiiit...
- Extract physics from the data

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

09/12/2010 16 / 90

- GR: "Space and time exist as a unity: Spacetime"
- NR: ADM 3+1 split Arnowitt, Deser & Misner '62 York '79, Choquet-Bruhat & York '80

$$\boldsymbol{g}_{\alpha\beta} = \left(\begin{array}{c|c} -\alpha^2 + \beta_m \beta^m & \beta_j \\ \hline \beta_i & \gamma_{ij} \end{array} \right)$$

- 3-Metric γ_{ij} Lapse α Shift β^i
- lapse, shift \Rightarrow Gauge

< ロ > < 同 > < 回 > < 回 >

ADM Equations

The Einstein equations $R_{\alpha\beta} = 0$ become

• 6 Evolution equations

$$(\partial_t - \mathcal{L}_\beta)\gamma_{ij} = -2\alpha K_{ij}$$

 $(\partial_t - \mathcal{L}_\beta)K_{ij} = -D_i D_j \alpha + \alpha [R_{ij} - 2K_{im}K^m_j + K_{ij}K_j]$

- 4 Constraints
 - $R + K^2 K_{ij}K^{ij} = 0$ $-D_jK^{ij} + D^iK = 0$

preserved under evolution!

- Evolution
 - 1) Solve constraints
 - 2) Evolve data

U. Sperhake (CSIC-IEEC)

• One can easily change variables. E. g. wave equation

$$\partial_{tt} u - c \partial_{xx} u = 0 \qquad \Leftrightarrow \qquad \partial_t F - c \partial_x G = 0$$

 $\partial_x F - \partial_t G = 0$

BSSN: rearrange degrees of freedom

$$\begin{split} \chi &= (\det \gamma)^{-1/3} & \tilde{\gamma}_{ij} = \chi \gamma_{ij} \\ K &= \gamma_{ij} K^{ij} & \tilde{A} = \chi \left(K_{ij} - \frac{1}{3} \gamma_{ij} K \right) \\ \tilde{\Gamma}^{i} &= \tilde{\gamma}^{mn} \tilde{\Gamma}^{i}_{mn} = -\partial_{m} \tilde{\gamma}^{im} \end{split}$$

Shibata & Nakamura '95, Baumgarte & Shapiro '98

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

Formulations I: BSSN

$$\begin{split} ds^2 &= -\alpha^2 dt^2 + \gamma_{ij} (dx^i + \beta^i dt) (dx^j + \beta^j dt) \\ \hline \phi &= \frac{1}{12} \ln \gamma \qquad \hat{\gamma}_{ij} = e^{-4\phi} \gamma_{ij} \\ K &= \gamma_{ij} K^{ij} \qquad \hat{A}_{ij} = e^{-4\phi} \left(K_{ij} - \frac{1}{3} \gamma_{ij} K \right) \\ \hat{\Gamma}^i &= \gamma^{ij} \hat{\Gamma}^i_{jk} = -\partial_j \hat{\gamma}^{ij} \\ (\partial_t - \mathcal{L}_\beta) \hat{\gamma}_{ij} &= -2\alpha \hat{A}_{ij} \\ (\partial_t - \mathcal{L}_\beta) \phi &= -\frac{1}{6} \alpha K \\ (\partial_t - \mathcal{L}_\beta) \hat{A}_{ij} &= e^{-4\phi} \left(-D_i D_j \alpha + \alpha R_{ij} \right)^{\text{TF}} + \alpha (K \hat{A}_{ij} - 2 \hat{A}_{ik} \hat{A}^k_j) \\ (\partial_t - \mathcal{L}_\beta) K &= -D^i D_i \alpha + \alpha \left(\hat{A}_{ij} \hat{A}^{ij} + \frac{1}{3} K^2 \right) \\ \partial_t \hat{\Gamma}^i &= 2\alpha \left(\hat{\Gamma}^i_{jk} \hat{A}^{jk} + 6 \hat{A}^{ij} \partial_j \phi - \frac{2}{3} \hat{\gamma}^{ij} \partial_j K \right) - 2 \hat{A}^{ij} \partial_j \alpha + \hat{\gamma}^{jk} \partial_j \partial_k \beta^i \\ &+ \frac{1}{3} \hat{\gamma}^{ij} \partial_j \partial_k \beta^k + \beta^j \partial_j \hat{\Gamma}^i + \frac{2}{3} \hat{\Gamma}^i \partial_j \beta^j \\ & \quad \textbf{Yo et al.} (2002) \end{split}$$

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 20 /

Formulations II: Generalized harmonic (GHG)

- Harmonic gauge: choose coordinates such that $abla_\mu
 abla^\mu x^lpha = \mathbf{0}$
- 4-dim. version of Einstein equations $R_{\alpha\beta} = -\frac{1}{2}g^{\mu\nu}\partial_{\mu}\partial_{\nu}g_{\alpha\beta} + \dots$ Principal part of wave equation
- Generalized harmonic gauge: $H_{\alpha} \equiv g_{\alpha\nu} \nabla_{\mu} \nabla^{\mu} x^{\nu}$ $\Rightarrow R_{\alpha\beta} = -\frac{1}{2} g^{\mu\nu} \partial_{\mu} \partial_{\nu} g_{\alpha\beta} + \dots - \frac{1}{2} (\partial_{\alpha} H_{\beta} + \partial_{\beta} H_{\alpha})$ Still principal part of wave equation !!!

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 21 / 9

・ロ・・ 日・ ・ ヨ・ ・ ヨ・ ・ りゅつ

The gauge in GHG

• Relation between H_{α} and lapse α and shift β^i :

$$\begin{aligned} H_{\mu}n^{\mu} &= -K - \frac{1}{\alpha^{2}} \left(\partial_{0}\alpha - \beta^{i}\partial_{i}\alpha \right) \\ \bot^{i}{}_{\mu}H^{\mu} &= \frac{1}{\alpha}\gamma^{ik}\partial_{k}\alpha + \frac{1}{\alpha^{2}} \left(\partial_{0}\beta^{i} - \beta^{k}\partial_{k}\beta^{i} \right) - \gamma^{mn}\Gamma^{i}_{mn} \end{aligned}$$

Auxiliary constraint

 $\mathcal{C}_{\gamma}\equiv \mathcal{H}_{\gamma}-\Gamma^{\mu}_{\mu\gamma}+g^{\mu
u}\partial_{\mu}g_{
u\gamma}$

Requires constraint damping

Gundlach et al. '05

(日)

The gauge freedom

- Remember: Einstein equations say nothing about α , β^i
- Any choice of lapse and shift gives a solution
- This represents the coordinate freedom of GR
- Physics do not depend on α , β^i So why bother?
- The performance of the numerics DO depend strongly on the gauge!
- How do we get good gauge?
 Singularity avoidance, avoid coordinate stretching, well posedness

Initial data

Two problems: Constraints, realistic data

• Rearrange degrees of freedom York-Lichnerowicz split: $\gamma_{ij} = \psi^4 \tilde{\gamma}_{ij}$ $K_{ji} = A_{ji} + \frac{1}{3} \gamma_{ji} K$

York & Lichnerozwicz, O'Murchadha & York,

Wilson & Mathews, York

- Make simplifying assumptions Conformal flatness: $\tilde{\gamma}_{ij} = \delta_{ij}$
- Find good elliptic solvers

U. Sperhake (CSIC-IEEC)

・ロット (雪) (日) (日) 日

Two families of initial data

• Generalized analytic solutions:

Isotropic Schwarzschild $ds^2 = \frac{M-2r}{M+2r}dt^2 + (1 + \frac{M}{2r})^4 (dr^2 + r^2 d\Omega)$

- \Rightarrow Time-symmetric N holes
- \Rightarrow Spin, Momenta
- \Rightarrow Punctures

Brill & Lindquist, Misner '60s

Bowen & York '80

Brandt & Brügmann '97

- Excision data: horizon boundary conditions Meudon Group, Pfeiffer, Ansorg
- Remaining problems: 1) junk radiation

2) We often want zero eccentricity

・ロット (雪) (日) (日) 日

Mesh refinement

3 Length scales : BH $\sim 1 M$ Wavelength $\sim 10...100 M$ Wave zone $\sim 100...100 M$

- Critical phenomena Choptuik '93
- First used for BBHs
 Brügmann '96

Singularity treatment

- Cosmic censorship ⇒ horizon protects outside
- We get away with it...
 - Moving Punctures
 - UTB, NASA Goddard '05
- Excision: Cut out region around singularity

Caltech-Cornell, Pretorius

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

9/12/2010 31 / 90

Extracting physics I: Global quantities

- ADM mass: Total energy of the spacetime $M_{\text{ADM}} = \frac{1}{16\pi} \lim_{r \to \infty} \int_{S_r} \sqrt{\gamma} \gamma^{ij} \gamma^{kl} \left(\partial_j \gamma_{ik} - \partial_k \gamma_{ij} \right) dS_l$
- Total angular momentum of the spacetime $P_{i} = \frac{1}{8\pi} \lim_{r \to \infty} \int_{S_{r}} \sqrt{\gamma} \left(K^{m}_{i} - \delta^{m}_{i} K \right) dS_{m}$ $J_{i} = \frac{1}{8\pi} \epsilon_{il}{}^{m} \lim_{r \to \infty} \int_{S_{r}} \sqrt{\gamma} x^{l} \left(K^{n}_{m} - \delta^{n}_{m} K \right) dS_{n}$

By construction all of these are time independent !!

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

・ロ・・ 日・ ・ ヨ・ ・ ヨ・ ・ りゅつ

Extracting physics II: Local quantities

- Often impossible to define!!
- Isolated horizon framework Ashtekar et al.

 \rightarrow Calculate apparent horizon \rightarrow Irreducible mass, momenta associated with horizon

$$M_{
m irr} = \sqrt{rac{A_{
m AH}}{16\pi}}$$

• Total BH mass Christodoulou $M^2 = M_{
m irr}^2 + rac{S^2}{4M_{
m irr}^2} + P^2$

• Binding energy of a binary: $E_{\rm b} = M_{\rm ADM} - M_1 - M_2$

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

9/12/2010 33 / 9

(日)

Extracting physics III: Gravitational Waves

- Most important diagnostic: Emitted GWs
- Newman-Penrose scalar

 $\Psi_4 = C_{lphaeta\gamma\delta} n^lpha ar{m}^eta n^\gamma ar{m}^\delta$

 $Complex \Rightarrow 2 \text{ free functions}$

- GWs allow us to measure
 - \rightarrow Radiated energy $E_{\rm rad}$
 - ightarrow Radiated momenta $P_{\rm rad}, J_{\rm rad}$
 - \rightarrow Angular dependence of radiation
 - ightarrow Gravitational wave strain h_+ , $h_ imes$

Angular dependence of GWs

• Waves are normally extracted at fixed radius *r*ex

 $\Rightarrow \Psi_4 = \Psi_4(t,\theta,\phi)$

 θ , ϕ are viewed from the source frame!

• Decompose angular dependence using spherical harmonics $\Psi_4 = \sum_{\ell,m} \psi_{\ell m}(t) Y^{-2} \ell m(\theta, \phi)$ Modes $\psi_{\ell m}(t) = A_{\ell m}(t) \times e^{i\phi(t)}$ Spin-weighted spherical harmonics $Y_{\ell m}^{-2}$

Motivation (High-energy physics)

Black Holes on Demand

Scientists are exploring the possibility of producing miniature black holes on demand by smashing particles together. Their plans hinge on the theory that the universe contains more than the three dimensions of everyday life. Here's the idea:

their gravitational attraction increases steadily.

space with more dimensions. shown above as a cube

more rapidly so a black hole can form

sending out a unique pattern of radiation

Experimental signature at the LHC

Black hole formation at the LHC could be detected by the properties of the jets resulting from Hawking radiation.

- Multiplicity of partons: Number of jets and leptons
- Large transverse energy
- Black-hole mass and spin are important for this!

ToDo:

- Exact cross section for BH formation
- Determine loss of energy in gravitational waves
- Determine spin of merged black hole

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

Black-hole collisions in D = 4

- Take two black holes
 - Total rest mass: $M_0 = M_{A, 0} + M_{B, 0}$ Initial position: $\pm x_0$ Linear momentum: $\mp P[\cos \alpha, \sin \alpha, 0]$
- Impact parameter: $b \equiv \frac{L}{P}$

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

09/12/2010 56 / 90

Head-on collisions: b = 0, $\vec{S} = 0$

• Total radiated energy: 14 ± 3 % for $v \rightarrow 1$

Sperhake et al. '08

About half of Penrose '74

Agreement with approximative methods

Flat spectrum, multipolar GW structure

Berti et al. '10

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 57 / 9

Grazing collisions: $b \neq 0$, $\vec{S} = 0$, $\gamma = 1.52$

Immediate vs. Delayed vs. No merger Sperhake et al. '09

U. Sperhake (CSIC-IEEC

Colliding black holes in 3+1 and higher dimensions

09/12/2010 58 / 9

Critical impact parameter

- $b < b_{crit} \Rightarrow Merger$ $b > b_{crit} \Rightarrow Scattering$
- Numerical study: $b_{crit} = \frac{2.5 \pm 0.05}{v} M$ Shibata *et al.* '08
- Independent study by Sperhake et al. '09
 - $\gamma = 1.52$: 3.39 < $b_{\rm crit}/M$ < 3.4
 - $\gamma =$ 2.93: 2.3 < $b_{\rm crit}/M$ < 2.4
 - $v \rightarrow 1$ limit still needs to be determined
- Limit from Penrose construction: b_{crit} = 1.685 M
 Yoshino & Rychkov '05

U. Sperhake (CSIC-IEEC)

Colliding black holes in 3+1 and higher dimensions

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

Radiated quantities

- *b*-sequence with $\gamma = 1.52$
- Final spin close to Kerr limit
- $E_{\rm rad} \sim 35$ % for $\gamma = 2.93$; about 10 % of Dyson luminosity

Sperhake et al. '09

Summary

- Black holes are real objects in many areas of physics!
- Astrophysics: Recoil, Spin flips, jets
- Gravitational wave physics: template banks needed
- High-energy collisions in D = 4: largest kicks ~ 15 000 km/s largest radiation ~ 30 % largest post-merger spin $a \lesssim 1$
- Formalism for arbitrary spatial dimension D
- Head-on collisions from rest
- Test non-assymptotically flat OBCs
- Signs of cosmic censorship violation in D = 5
